BUREAU OF INDIAN STANDARDS
MANAK BHAVAN, 9 BAHADUR SHAH ZAFAR MARG
NEW DELHI 110002

FOREWORD

This Indian Standard (Third Revision) was adopted by the Bureau of Indian Standards, after the draft finalized by Water Sectional Committee had been approved by the Chemical Division Council.

This Indian Standard was first issued in 1957 concerning water purified by thermal distillation only. It was revised in 1960 in which water purified by other methods also were incorporated. In the light of work carried out at the international level, this standard was again revised in 1977 incorporating the requirements for residue on ignition and specific conductivity.

Based on the experience gained over the years, the technical committee responsible for the formulation of this standard decided to revise it again to cover different grades of reagent water used for different purposes and also to align it with ISO 3696 : 1987 'Water for analytical laboratory use — Specification and test methods' on this subject. In this revision, limits for three grades of water depending on their end use have been specified and the characteristics have also been suitably modified.

The requirements for chlorides, sulphates, ammonia, calcium, magnesium and heavy metals are more broadly reflected by the requirement electrical conductivity and therefore need not be covered separately for convenience and simplicity. The requirement for silica content has been incorporated as it is a significant parameter for evaluation of reagent grade water.

It is important to prepare in the laboratory or purchase from outside, the reagent grade water to be used for dilution of reagents and blank analysis. Generally reagent grade water means the distilled or de-ionized water with no detectable amount of the compound or the element to be analysed at the detection limit of analytical procedure.

Distillation removes water miscible organics and ionizable inorganic impurities, as well as colloidal solids from water. The quality of resulting distillate varies with the original source of the water, the material from which distillation apparatus was constructed and the number of distillations. Generally metal stills yield a product inferior to that obtained from borosilicate glass or vitreous silica. Multiple distillations from vitreous/silica usually required to obtain high purity water which is also relatively free from organic traces.

Distillation, de-ionization, reverse osmosis all can produce reagent water in suitable arrangement to obtain the desired quality of water.

For the purpose of deciding whether a particular requirement of this standard is complied with, the final value, observed or calculated, expressing the result of a test or analysis, shall be rounded off in accordance with IS 2 : 1960 'Rules for rounding off numerical values (*revised*)'. The number of significant places retained in the rounded off value should be the same as that of the specified value in this standard.

Indian Standard

REAGENT GRADE WATER — SPECIFICATION (Third Revision)

1 SCOPE

1.1 This standard prescribes requirements and methods of test for reagent grade water for laboratory use. General guidelines for storage of the reagent water are also given.

1.2 It does not cover water for biological or medical and organic trace analysis.

2 REFERENCES

The following Indian Standards are necessary adjuncts to this standard:

IS No.	Title
3025 (Part 11) : 1983	Methods of sampling and test (physical and chemical) for water and wastewater : Part 11 pH value (<i>first revision</i>)
3050 (Part 14) : 1984	Methods of sampling and test (physical and chemical) for water and wastewater : Part 14 Specific conductance (wheatstone bridge, conductance cell) (<i>first revision</i>)
3025 (Part 15) : 1984	Methods of sampling and test (physical and chemical) for water and wastewater : Part 15 Total residue (total solids-dissolved and suspended) (<i>first revision</i>)
3025 (Part 35) : 1988	Methods of sampling and test (physical and chemical) for water and wastewater : Part 35 Silica (<i>first revision</i>)
4905 : 1968	Methods for random sampling

3 GRADES

The reagent grade water shall be of the following three grades depending on their extent of purity:

Grade 1 : For use in test methods requiring minimum interference and maximum precision and accuracy such as trace analysis. Reagent water may be prepared by distillation of feed water having maximum conductivity of 20 $\mu\text{mhos/cm}$ at 25°C followed by polishing with mixed bed deionizers and passage through 0.45 μm membrane filter.

Grade 2 : For use in the general laboratory analytical procedures where freedom from organic impurities is of more significance. It is not applicable for biological or medical analysis and organic trace analysis.

Grade 3 : For use in washing of glasswares, preliminary rinsing of glassware and feed water for production of higher grade waters or where large quantity of water is required of low purity for make up of synthetic test solutions.

4 REQUIREMENTS

4.1 Description

The material shall be suitably treated by thermal distillation or ion exchange method and purified subsequently if necessary. It shall be clear, colourless, odourless and tasteless.

4.2 The material shall also comply with the requirements given in Table 1.

5 STORAGE

5.1 Contamination of water during storage may arise mainly from dissolution of suitable constituents from glass or plastic containers or absorption of atmospheric carbon dioxide and or any other impurities present in the laboratory atmosphere. For this reason, the storage of grade 1 and grade 2 water is not recommended. It is desirable to prepare, as required for immediate use.

NOTE — In case it is required to store grade 1 and grade 2 water it can be done with proper storage systems having carbon dioxide breather and with seal arrangement.

However, grade 2 water may be prepared in reasonable quantity and stored in suitable, inert, clear, tight full containers which have been thoroughly pre-washed with water of same grade.

The storage of grade 3 water possess little problem, and should be stored in containers that do not affect the quality for the desired purpose. Let the containers and storage conditions should be the same as those used for the storage of grade 2 water.

NOTE — It is recommended that storage container be reserved exclusively for the storage of grade 3 water.

Table 1 Requirement for Reagent Grade Water
(Clause 4.2)

Sl No.	Characteristic	Requirement			Method of Test, Ref to Part of IS No.
		Grade 1	Grade 2	Grade 3	
(1)	(2)	(3)	(4)	(5)	(6)
i)	Specific conductivity μ mhos/cm at 25°C, <i>Max</i>	0.1 (see Note 1)	1.0 (see Note 1)	5.0	3025 (Part 14) : 1984
ii)	pH, at 25°C	(see Note 2)	(see Note 2)	5.0-8.0	3025 (Part 11) : 1983
iii)	Total solids or non volatile residue at 105°C, mg/l <i>Max</i>	(see Note 3)	1.0	2.0	3025 (Part 15) : 1984
iv)	Silica (as SiO ₂), mg/l, <i>Max</i>	0.01	0.1	1.0	3025 (Part 35) : 1988
v)	Colour retention of KMnO ₄ , at 27 × 2°C Minutes	60	10	10	Annex A

NOTES

- 1 The requirement for specific conductivity for grade 1 and grade 2 apply to freshly prepared water. During storage it is possible for contaminants like atmospheric carbon dioxide and alkalies from glass containers, to be dissolved leading to changes in conductivity.
- 2 Because of the difficulties associated with measurement of the pH value of high purity water, and the doubtful significance of the value obtained, limits for the pH of grade 1 and grade 2 water have not been specified.
- 3 The limit for oxidizable matter and residue after evaporation for grade 1 water is not specified because of the difficulty of testing for compliance at this level of purity, the quality of grade 1 water is, however, assured by compliance with the other requirements and by its method of preparation.

6. PACKING AND MARKING

6.1 Packing

The material shall be packed in clean glass, polyethylene or other suitable plastic container which do not affect the quality of water. The containers shall be securely closed.

6.2 Marking

The containers shall bear legibly and indelibly the following information:

- a) Name of the material;
- b) Indication of source of manufacture;
- c) Volume of the material in litres;
- d) Date of manufacture; and
- e) Batch number.

7 SAMPLING

Representative samples of the material shall be drawn as prescribed in Annex B.

8 TESTS

8.1 Tests shall be carried out according to methods prescribed in Annex A and as indicated in col 6 of Table 1.

8.2 Quality of Reagents

Unless specified otherwise, pure chemicals and distilled or deionized water shall be employed in tests.

NOTE — 'Pure chemicals' shall mean chemicals that do not contain impurities which affect the results of analysis.

ANNEX A

[Table 1, Item (v)]

COLOUR RETENTION TIME (OXIDIZABLE MATTER)

A-1 REAGENTS

A-1.1 Sulphuric Acid — Concentrated AR grade (sp gr 1.84).

A-1.2 Potassium Permanganate Solution

Dissolve 0.316 of potassium permanganate in reagent grade water and dilute to 1 litre.

A-2 PROCEDURE

To 500 ml of water sample add 1 ml of concentrated sulphuric acid and 0.2 ml of potassium permanganate solution in a stoppered bottle of chemically resistant glass. Sample is considered to pass the test if the permanganate colour does not disappear completely after standing for the

indicated period of time at room temperature. This test should be run against a blank using

water known to be free from organic substances.

ANNEX B

(Clause 7)

SAMPLING

B-1 GENERAL REQUIREMENTS

B-1.0 In drawing, preparing, storing and handling samples, the following precautions and directions shall be observed.

B-1.1 Samples shall not be taken in an exposed place.

B-1.2 The sampling instruments shall be clean. Before use these shall be washed several times with the material to be sampled.

B-1.3 Precautions shall be taken to protect the samples, the material being sampled, the sampling instruments and the containers for samples from adventitious contamination.

B-1.4 To draw a representative sample, the contents of each container selected for sampling shall be mixed as thoroughly as possible by suitable means.

B-1.5 The samples shall be placed in a clean and airtight glass bottle or other suitable containers on which the material has no action and which have been previously washed several times with the material to be sampled.

B-1.6 The sample container shall be of such size that they are filled by the sample leaving an ullage of 10 percent.

B-1.7 Each sample container shall be sealed airtight after filling, and marked with full details of sampling, the date of sampling and the year of manufacture of the material.

B-2 SCALE OF SAMPLING

B-2.1 Lot

All containers in a single consignment of the material drawn from a single batch of manufacture shall constitute a batch. If a consignment is declared or known to consist of different batches of manufacture, the batches shall be marked separately and the groups of containers in each batch shall constitute separate lots.

B-2.2 For ascertaining conformity of the material in a lot to the requirements of this specification, sample shall be tested for each lot separately. The number of containers to be selected at random from lots of different sizes shall be in accordance with Table 2.

B-2.2.1 The containers shall be selected at random from the lot and in order to ensure the randomness of selection, the random sampling methods given in IS 4905 : 1968 may be followed.

Table 2 Number of Containers to be Selected from Lots of Different Sizes

(Clause B-2.2)

Lot Size <i>N</i>	Sample Size <i>n</i>
(1)	(2)
Up to 15	3
16 to 25	4
26 to 50	5
51 to 100	7
101 to 150	8
151 and above	10

B-3 PREPARATION OF TEST SAMPLES

B-3.1 The containers shall be selected according to **B-2.2.1**, equal portions of the material shall be taken out so that the total quantity collected from all the containers is about 15 litres. This shall be the composite sample.

B-3.2 The composite sample shall be divided into three test samples not less than 5 litres each. These test samples shall be transferred immediately to thoroughly washed bottles and sealed airtight with glass stoppers and marked with the particulars of sampling as given in **B-1.7**. One test sample shall be sent to the purchaser and one to the supplier. The third test sample bearing the seals of the purchaser and the supplier shall constitute the reference sample, to be used in case of dispute.

B-4 NUMBER OF TESTS AND CRITERIA FOR CONFORMITY

B-4.1 All the characteristics given in Table 1 shall be tested on the composite sample.

B-4.2 The lot shall be declared as conforming to the requirements of this specification if all the test results on the composite sample meet the relevant requirements given in Table 1, otherwise not.

Bureau of Indian Standards

BIS is a statutory institution established under the *Bureau of Indian Standards Act, 1986* to promote harmonious development of the activities of standardization, marking and quality certification of goods and attending to connected matters in the country.

Copyright

BIS has the copyright of all its publications. No part of these publications may be reproduced in any form without the prior permission in writing of BIS. This does not preclude the free use, in the course of implementing the standard, of necessary details, such as symbols and sizes, type or grade designations. Enquiries relating to copyright be addressed to the Director (Publications), BIS.

Review of Indian Standards

Amendments are issued to standards as the need arises on the basis of comments. Standards are also reviewed periodically; a standard along with amendments is reaffirmed when such review indicates that no changes are needed; if the review indicates that changes are needed, it is taken up for revision. Users of Indian Standards should ascertain that they are in possession of the latest amendments or edition by referring to the latest issue of 'BIS Handbook' and 'Standards Monthly Additions'.

This Indian Standard has been developed from Doc : No. CHD 013 (0219)
