NATIONAL FOREWORD

This Indian Standard which is identical with ISO 12040 : 1997 'Graphic technology — Prints and printing inks — Assessment of light fastness using filtered xenon arc light' issued by the International Organization for Standardization (ISO) was adopted by the Bureau of Indian Standards on the recommendations of the Printing Inks, Stationery and Allied Products Sectional Committee and approval of the Chemical Division Council.

The text of this ISO Standard has been approved as suitable for publication as an Indian Standard without deviations. Some terminology and certain conventions are however, not identical to those used in Indian Standards. Attention is particularly drawn to the following:

- a) Wherever the words 'International Standard' appear referring to this standard, they should be read as 'Indian Standard'
- b) Comma (,) has been used as a decimal marker while in Indian Standards, the current practice is to use a point (.) as the decimal marker.

This standard refers to ISO 105-A02 : 1993, ISO 105-B02 : 1994, ISO 2834 : 1981 and ISO 3664 : 1975 against which there is no Indian Standards. The technical committee responsible for the preparation of this standard has reviewed the provisions of ISO 105-A02 : 1993, ISO 105-B02 : 1994, ISO 2834 : 1981 and ISO 3664 : 1975 referred in this adopted standard and decided that these are acceptable for use in conjunction with this standard.

For tropical countries like India, the standard temperature and the relative humidity shall be taken as $27 \pm 2^{\circ}\text{C}$ and 65 ± 5 percent respectively.

For the purpose of deciding whether a particular requirement of this standard is complied with, the final value, observed or calculated, expressing the result of a test, shall be rounded off in accordance with IS 2 : 1960 'Rules for rounding off numerical values (*revised*)'. The number of significant places retained in the rounding off value should be the same as that of the specified value in this standard.

Introduction

The method for evaluating light fastness described in this International Standard using blue wool references is in technical conformity with the method given in ISO 2835. However, according to the latter, natural daylight shall be used to obtain a valid assessment of light fastness. This International Standard describes an accelerated test method by specifying the light source and filters for daylight simulation as well as exposure of the test samples to artificial daylight.

In addition, this International Standard is partly in agreement with ISO 105-B02. For more information on apparatus and test methods, ISO 105-B02 is recommended as a reference.

Indian Standard

GRAPHIC TECHNOLOGY — PAINTS AND PRINTING INKS — ASSESSMENT OF LIGHT FASTNESS USING FILTERED XENON ARC LIGHT

1 Scope

This International Standard specifies a method for assessing the light fastness of prints and printing inks, by giving

- the general test requirements for prints;
- the special test requirements for inks.

This International Standard applies to all print substrates such as paper, board, metals (thin metal sheets and plate) and plastic films and to all printing processes.

2 Normative references

The following standards contain provisions which, through reference in this text, constitute provisions of this International Standard. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this International Standard are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below. Members of IEC and ISO maintain registers of currently valid International Standards.

ISO 105-A02:1993, *Textiles — Tests for colour fastness — Part A02: Grey scale for assessing change in colour.*

ISO 105-B02:1994, *Textiles — Tests for colour fastness — Part B02: Colour fastness to artificial light: Xenon arc fading lamp test.*

ISO 2834:1981, *Printing inks — Preparation of standardized prints for determination of resistance to physical and chemical agents.*

ISO 3664:1975, *Photography — Illumination conditions for viewing colour transparencies and their reproductions.*

3 Definitions

For the purposes of this International Standard, the following definitions apply.

3.1 light fastness of prints to filtered xenon arc light: Resistance of the print to the effects of a fixed light source (filtered xenon arc light) without direct influence from the weather.

3.2 light fastness of a printing ink: Resistance of a standard print assessed in accordance with the instructions given in this International Standard relating to prints.

4 Test methods

4.1 Principle

A test piece together with blue wool references is exposed to xenon arc light under specified conditions at the same time.

Light fastness is evaluated by noting on the scale of blue wool references the rating of that reference which has undergone a change similar to that of the test print.

4.2 Apparatus and materials¹⁾

4.2.1 Xenon arc lamp apparatus

The instrument chosen may be either air cooled or water cooled and shall be used as indicated by the manufacturer.

4.2.2 Blue wool references

The light fastness of prints is estimated by comparison with a standard range of eight blue dyes on wool cloth, their degree of light fastness being in regular steps. These dyes are largely unaffected by variation in temperature and humidity, and constitute an acceptable scale for the determination of the light fastness of all types of prints, whatever their colour, type and intensity.

The light fastness of prints is expressed as the number corresponding to one of the eight blue wool references. The range "1" denotes the lowest degree of light fastness and "8" the highest.

The eight ranges are as follows:

1	Very poor	5	Good
2	Poor	6	Very good
3	Moderate	7	Excellent
4	Relatively good	8	Outstanding

The range of the blue wool references is that established for textiles (see table 1). The blue wool references shall be protected from light before use.

Table 1

Light-fastness rating	Dye
1	Acid blue 104
2	Acid blue 109
3	Acid blue 83
4	Acid blue 121
5	Acid blue 47
6	Acid blue 23
7	Solubilized Vat blue 5
8	Solubilized Vat blue 8

The details shown in the column "Dye" correspond to the specifications given in the same column of the relevant table in ISO 105-B02.

389 Chiswick High Road
LONDON W4 4AL
United Kingdom

4.2.3 Grey scale

A grey scale is used for the determination of colour change in accordance with ISO 105-A02.

4.2.4 Black-Panel-Thermometer

The Black-Panel-Thermometer is used as a standard reference to assess the temperature of the test sample due to the absorption of black body radiation. It shall include a metal plate with dimensions of not less than 45 mm × 100 mm, whose temperature is measured by means of a thermometer or a thermocouple (see 4.3.2). The sensitive part of this thermometer shall be in good contact with the centre of the metal plate. The part of the metal plate facing the light source shall be covered with a black coating, which has an infrared reflection of less than 5 % of the amount of light which strikes the test pieces. The side which is not facing the light source shall be thermally insulated.

4.2.5 Light source

The light source is a xenon arc lamp with a colour temperature of 5 500 K to 6 500 K.

4.2.6 Filter

A plane glass plate shall be placed between the light source and the test pieces and/or blue wool references in order to reduce constantly the ultraviolet radiation from the xenon arc lamp. This filter should completely absorb radiation at wavelengths below 310 nm. The transparency of the glass filters shall be at least 90 % in the range of wavelengths from 380 nm to 700 nm (simulating sunlight behind window glass).

4.3 Procedure

4.3.1 Preparation for testing

The test pieces and the blue wool references are mounted together and partly covered by opaque board, the thickness of which is at least 0,5 mm (for example board rendered impervious to infrared radiation by being covered with a sheet of aluminium).

4.3.2 Illumination and test conditions

The test pieces and blue wool references are mounted together as closely as possible in a well-ventilated test chamber and shall be exposed to the same amount of radiation.

The temperature of the test pieces shall not exceed 45 °C as measured by the Black-Panel-Thermometer. If glass or water filters are used to avoid high temperatures resulting from infrared radiation, they shall be cleaned frequently in order to avoid filtering of the light caused by dirt. Furthermore, the instructions from the supplier concerning lifetime of lamps and exchange of filters shall be respected.

4.4 Light fastness of prints

4.4.1 Exposure

The test is carried out as follows.

Expose the samples to the light in a prescribed manner for a time sufficient to cause a distinct change.

A distinct change is defined as equal to or less than grade 3 of the grey scale referenced in 4.2.3. The operator should take precautions to make sure that he does not experience light fatigue during the operation and that standard graphic arts viewing conditions (see ISO 3664) are used for the visual checks.

Determine which of the blue wool references has changed to an extent equal to that of the test piece.

NOTE 2 For a simultaneous and systematic examination of a series of prints, the following method is recommended for a single test:

- Expose all prints until reference 3 of the range of blue wool references shows a distinct change (grade 3 of the grey scale).
- Cover approximately a quarter of the exposed part of the print and of the reference and continue exposure to light until reference 5 shows a distinct change.
Cover a quarter of the remaining exposed part and continue to expose to light until a clearly visible change corresponding to grade 3 of the grey scale is noted in reference 6.
- Cover once more and continue exposure to the point where a change in reference 7 becomes just visible (grade 4 of the grey scale).

This process of exposure by successive coverings makes it possible to assess prints with very different degrees of light fastness in a single test.

4.4.2 Evaluation

Give the test piece a light-fastness rating that corresponds to the number of the blue wool reference that has a distinct change (grade 3) at the same time that the test piece shows a distinct change. Should the change in the test piece fall between the changes of two successive references, the test piece should be given the two corresponding ratings (e.g. 6-7). This method of grading shall not be used below rating 5. If the test piece's colour darkens, the light fastness is followed by the letter "N".

4.5 Light fastness of the substrate

Optionally, the light fastness of the substrate may be assessed, in which case it shall be tested according to the procedure described in this International Standard.

Time required for the test piece to show a distinct change (see 4.4.2).

5 Testing of inks

Inks shall be tested by first preparing standardized prints on a reference paper as specified in ISO 2834. The standard prints shall then be tested and evaluated as specified in clause 4 of this International Standard.

6 Test report

The test report shall include the following information:

- a) Reference to this International Standard;
- b) Light-fastness rating;
- c) Indication if specific humidity and temperature conditions²⁾ have been used;
- d) Test conditions (see 4.3.2);
- e) Type and model of light-fastness test instrument and an indication if any form of light-dark cycling was used;
- f) If the light fastness of the substrate was tested (see 4.5), the above information on this test.

2) Normally, it is sufficient to carry out testing of light fastness under general climate conditions. Otherwise, see ISO 105-B02.

Review of Indian Standards

Amendments are issued to standards as the need arises on the basis of comments. Standards are also reviewed periodically; a standard along with amendments is reaffirmed when such review indicates that no changes are needed; if the review indicates that changes are needed, it is taken up for revision. Users of Indian Standards should ascertain that they are in possession of the latest amendments or edition by referring to the latest issue of 'BIS Catalogue' and 'Standards : Monthly Additions'.

This Indian Standard has been developed from Doc : No. CHD 14 (1096).
