Indian Standard

AUDIO, VIDEO AND AUDIOVISUAL SYSTEMS — INTERCONNECTIONS AND MATCHING VALUES — PREFERRED MATCHING VALUES OF ANALOGUE SIGNALS

ICS 33.160.01

© BIS 2005

BUREAU OF INDIAN STANDARDS
MANAK BHAVAN, 9 BAHADUR SHAH ZAFAR MARG
NEW DELHI 110002

June 2005

Price Group 8
NATIONAL FOREWORD

This Indian Standard which is identical with IEC 61938 (1996) 'Audio, video and audiovisual systems — Interconnections and matching values — Preferred matching values of analogue signals' issued by the International Electrotechnical Commission (IEC) was adopted by the Bureau of Indian Standards on the recommendations of the Acoustics and Recording Sectional Committee and approval of the Electronics and Telecommunication Division Council.

Existing IS 9302 (Part 10) : 1980 'Characteristics and methods of measurements for sound system equipment: Part 10 Preferred matching values for the interconnection of sound system components' is based on IEC 60268-15 which has been withdrawn and replaced by IEC 61938. This revision has been undertaken to harmonize the Indian Standard with the IEC Standard.

The text of the IEC Standard has been approved as suitable for publication as an Indian Standard without deviations. Certain conventions are, however, not identical to those used in Indian Standards. Attention is particularly drawn to the following:

a) Wherever the words 'International Standard' appear referring to this standard, they should be read as 'Indian Standard'.

b) Comma (,) has been used as a decimal marker while in Indian Standards, the current practice is to use a point (.) as the decimal marker.

In this adopted standard, reference appears to certain International Standards for which Indian Standards also exist. The corresponding Indian Standards which are to be substituted in their places are listed below along with their degree of equivalence for the editions indicated:

<table>

1) Since revised.

(Continued on third cover)
1 General

1.1 Scope

This International Standard applies to electrical matching values for the interconnection of analogue signals amongst audio, video and AV system equipment.

This standard includes audio but not video signals for broadcast and similar use. Interconnections using the 21 contact connector described in IEC 807-9 are not included in this standard.

Matching values for vehicle applications are excluded.

For the interconnection of digital signals, it is necessary to refer to IEC 958.

NOTE – A diagram showing possible interconnections, with cross-references to the appropriate clauses, is given in figure 1.

1.2 Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of this International Standard. At the time of publication, the editions indicated were valid. All normative documents are subject to revision, and parties to agreements based on this International Standard are encouraged to investigate the possibility of applying the most recent editions of the normative documents listed below. Members of IEC and ISO maintain registers of currently valid International Standards.

IEC 27: Letter symbols to be used in electrical technology

IEC 38: 1983, IEC standard voltages, Part 1: General conditions and requirements

IEC/DIS 50(723): International Electrotechnical Vocabulary (IEV) – Chapter 723: Broadcasting: Sound, television and data

IEC 107-6: 1989, Recommended methods of measurement on receivers for television broadcast transmission – Part 6: Measurement under conditions different from broadcast signal standards

IEC 268-5: 1989, Sound system equipment – Part 5: Loudspeakers

IEC 268-7: 1984, Sound system equipment – Part 7: Headphones and headsets
2 General conditions and definitions

2.1 General conditions

All voltages are r.m.s. voltages, unless otherwise indicated.

Impedances of audio circuits are valid in the frequency range of 20 Hz to 20 kHz, unless otherwise indicated.

2.2 Definitions

For the purposes of this International Standard, the following definitions apply:

2.2.1 luminance signal: An electrical signal representing the luminance of the television picture elements. [IEV 723-05-56]

2.2.2 chrominance signal: An electrical signal that is associated with the luminance signal to convey colour information. In practice this signal is made up of two components. [IEV 723-05-57]

2.2.3 Y' signal, VBS signal: The Y' signal is a combined signal consisting of

- a luminance signal;
- blanking and synchronizing signals.

NOTE – The Y' signal equals the composite video signal (CVBS signal) without the C' signal.

2.2.4 colour signal, C'' signal: A chrominance signal with burst signal included, modulated on a subcarrier.
2.2.5 **blanking signal:** Signal used to control the suppression of the signal conveying picture information during certain parts of the scanning period, for example, during fly-back. [IEV 723-05-37]

2.2.6 **synchronizing signal:** A signal used to determine the timing for the scanning processes in transmission and reception. [IEV 723-05-36]

2.2.7 **composite video signal, composite video blanking synchronization or CVBS signal:** The composite video signal is a combined signal consisting of:
- a luminance signal;
- a colour signal;
- blanking and synchronizing signals.

2.2.8 **interface:** A shared boundary between two pieces of equipment, defined by functional characteristics, common physical interconnection characteristics, signal characteristics and other characteristics, as appropriate. [ISO/IEC 2382-9, modified]

2.2.9 **minimum output voltage:** The voltage measured across the rated load impedance of a piece of equipment, and related to a minimum input signal limited by signal to noise ratio.

2.2.10 **maximum output voltage:** The voltage measured across the rated load impedance of a piece of equipment and related to a maximum input signal limited by non-linearity.

2.2.11 **rated source impedance:** The internal impedance, stated by the manufacturer, of the source supplying the signal to the piece of equipment. Unless otherwise specified, the rated source impedance is assumed to be a constant pure resistance.

**NOTES**
1. The manufacturer may also give the range of source impedances which he considers tolerable in practice.
2. Multiple values, or a range of values, may be specified, providing the corresponding rated (distortion-limited) output voltages and/or powers are also stated.

2.2.12 **input impedance:** The internal impedance measured between the input terminal and its corresponding return of the piece of equipment.

2.2.13 **rated source e.m.f.:** The e.m.f. specified by the manufacturer which, when connected to the input terminals in series with the rated source impedance, gives rated distortion-limited output voltage across the rated load impedance at an appropriate setting of the controls.

2.2.14 **minimum source e.m.f. for rated output voltage:** The e.m.f. which, when connected to the input terminals in series with the rated source impedance, gives rated output voltage across the rated load impedance with the volume control(s), if any, set for maximum gain and the tone control(s), if any, set as specified for rated conditions.

2.2.15 **rated load impedance:** The impedance, specified by the manufacturer, to which the output terminals are to be connected for measuring purposes. Unless otherwise specified by the manufacturer, the rated load impedance shall be assumed to be a constant pure resistance.

**NOTE** - Multiple values, or a range of values, may be specified, providing the corresponding rated (distortion-limited) output voltages and/or powers are also stated.
2.2.16 **output source impedance**: The internal impedance measured between the output terminal and its corresponding return under specified conditions.

2.2.17 **rated output voltage**: The voltage specified by the manufacturer, measured across the rated load-impedance of a piece of equipment.

2.2.18 **overload source e.m.f.**: The maximum source e.m.f. for which a piece of equipment, connected as for rated conditions and with an appropriate setting of the volume control, can deliver an output voltage 10 dB below the rated distortion limited output voltage without exceeding the rated total harmonic distortion.

3 **Power supply**

3.1 **Alternating current (a.c.) power supply voltages and frequencies**

For a.c. power supply voltages and frequencies, reference is made to IEC 38.

For special applications, for example ships and aircraft, other voltages and/or frequencies and the permissible tolerances are subject to agreement between manufacturers and users.

3.2 **Direct current (d.c.) power supply voltages**

DC power supply voltages and the permissible tolerances are given in table 1. The equipment should operate over the range of voltages given, but may not necessarily meet all of its specifications at the given limits.

3.3 **Power supply feed for microphones**

Reference is made to 7.3, 7.4 and 7.5.

4 **Interconnections**

4.1 **Connections**

Signal cables shall have the appropriate electrical characteristics to permit the transfer of signals between the parts of a system without unacceptable impairment.
NOTE – The degree of impairment which is unacceptable depends on the system specification and the need to comply with other international standards, such as those concerning electromagnetic compatibility.

4.1.1 Characteristics of cables

The following characteristics of cables should be taken into account.

4.1.1.1 Resistance of the conductors

A resistance of less than one-hundredth of the load impedance is usually acceptable for loudspeaker connections. For other applications, values of one-tenth are acceptable.

NOTE – Long cables may therefore require conductors of larger cross-section area than those of short cables.

4.1.1.2 Insulation resistance

An insulation resistance of 50 MΩ is usually acceptable.

4.1.1.3 Inductance of conductors

This is normally only important for very long cables.

The acceptable value varies too widely to give more than general guidance. In the absence of particular requirements, the inductive reactance should not exceed one third of the load impedance at the highest frequency of interest.

NOTES
1. The inductance of an isolated single conductor (of typical length to diameter ratio of the type of cable normally used in these applications) is approximately 2 μH/m.
2. The requirement ensures less than approximately 1 dB loss at the highest frequency of interest.

4.1.1.4 Capacitance between conductors

The acceptable value varies too widely to give more than general guidance. For conductors carrying different audio signals, and in the absence of particular requirements, the capacitive reactance should exceed 1000 times the load impedance at the highest frequency of interest.

NOTE – This ensures that the relative crosstalk level is approximately –60 dB if the two conductors carry signals at similar levels.

4.1.1.5 Capacitance from conductor to screen

The acceptable value varies too widely to give more than general guidance. In the absence of particular requirements, the capacitive reactance should exceed three times the source impedance at the highest frequency of interest.

NOTE – This ensures less than approximately 1 dB loss at the highest frequency of interest.

4.1.1.6 Characteristic impedance

This is usually only important for high-frequency signals (such as digital signals in accordance with IEC 958).
4.1.1.7 Continuity of screening

In some applications, screening should be connected to contacts of connectors at both ends of the cable. In other cases, screening should be connected at one end of the cable only (for example to eliminate circulating currents). Cable and connector assemblies preferably should be marked to show which practice has been applied.

The screening of signal cables and connectors shall not be used as a means for the preservation of safety earth continuity for the prevention of electric shock hazard.

4.1.1.8 Efficiency of screening

The use of screening is meant to reduce the unwanted effects of electromagnetic disturbances, such as:

a) in reducing crosstalk between conductors in the same cable;

b) in reducing emission of unwanted signals from the cable;

c) in maintaining immunity from external signals entering via the cable.

NOTE – These characteristics are related, but good performance in one respect does not ensure good performance in another.

4.2 Connectors

For connectors used within the system, reference shall be made to the reference documents given in 1.2.

5 Marking and symbols for marking

5.1 Marking

Terminals and controls shall be adequately marked to give information regarding their function, characteristics and polarity.

The marking shall be such that it is possible to adjust the controls and to identify their positions with sufficient accuracy in connection with the information given in the user instructions.

5.2 Symbols for marking

Marking preferably should be composed of letter symbols, signs, numbers and colours, which are internationally intelligible. Reference is made to IEC 27, IEC 417, IEC 617 and IEC 1293.

Markings not included in the above-mentioned standards shall be clearly explained in the user instructions.

6 Electrical matching values

6.1 General purpose output/input

In order to preserve the maximum flexibility of use and compatibility in the design of equipment, all inputs of destination equipment, and all outputs of source equipment for general applications shall have the same specifications. These are termed "general purpose input/output".
The manufacturer may choose to designate some or all of these input/outputs for particular purposes, for example the general purpose input/output for audio signal would be designated for tuner, for tape recorder, or for auxiliary input, in order to simplify the operation, but the specification of all such inputs and outputs nevertheless shall be identical.

6.2 General purpose audio output/input

Values for general purpose audio input/output are given in Table 2, and in accompanying notes.

### Table 2 – General purpose matching values for audio signals

For notes, see following pages.
NOTES to tables 2a and 2b

1 The output voltages are measured with the rated load impedance connected.

2 The value corresponds to:
   a) an aerial input level of 40 dB (pW) for FM radio tuners, i.e. 0.86 mV across 75 Ω or 1.73 mV across 300 Ω. The modulation factor is 54 %;
   b) an aerial input e.m.f. of 1 mV for AM radio tuners. The modulation factor is 30 %;
   c) a vision carrier input level of 70 dB (µV) for TV sound tuners, having the sound to vision carrier ratio of the relevant television system (see ITU-R BT.470-4). The modulation factor is 54 % for both AM and FM.

   The modulation factor of the above signals is based on the average modulation factor of the relevant emissions, averaged over at least 15 s;
   b) the output of a tape player or monitor, when reproducing a calibration tape in accordance with IEC 94-2;
   c) the output of a digital audio source (see note 7), when reproducing a sinewave signal recorded at a level 12 dB below "full scale" (see note 4c) recorded digital signal;
   d) a source level equal to the average level of the system in other cases.

3 The value corresponds to:
   a) a level of 8 dB below the recording level given in 2b) above, in the case of a tape player or monitor;
   b) the minimum source e.m.f. to the input of the system (8 dB below the rated source e.m.f.) in other cases.

   The value as shown is not specified for tuners.

   In the case of a digital audio source (see note 7), it is not necessary to define a minimum output voltage since it is directly related to the rated output voltage.

4 The value corresponds to:
   a) the maximum r.f. input signal level and maximum modulation in the case of tuners. In some countries, FM emissions may exceed the rated maximum system deviation, while in others this is not permitted. AM emissions employing high-efficiency modulation techniques may produce at the receiver an audio output voltage corresponding to an apparent modulation of more than 100 %, up to approximately 150 %;
   b) the maximum recording level in the case of a tape player or monitor;
   c) the "full scale" level, which is the sinewave signal having positive and negative peak values represented by the digital values of 7FFFH and 8001H in a 16 bit system in the case of a digital audio source (see note 7). In the compact disc specification, these values correspond to a maximum (r.m.s.) analogue output voltage of 2 V ± 3 dB;
   d) the input of the system when applying the overload source e.m.f. (12 dB above the rated source e.m.f.) in other cases.

5 In the case of a tape recorder, the value which produces the same intensity of the magnetic field as that of the calibration tape in accordance with IEC 94-2.

6 For inputs intended only for the connection of analogue sources, the value is greater than or equal to 2.0 V. For inputs intended for the connection of analogue outputs of digital audio sources (see note 7), the value is greater than or equal to 2.8 V.

7 The digital audio source may be a compact disc (CD) player, a digital audio tape (DAT/DCC) recorder or player, a television receiver with digital sound reception facilities or a receiver for digital audio broadcast (see note 8)

8 For NICAM receivers, the relationship between the levels of alignment level tones transmitted by the broadcasting authorities and the maximum digital coding level, and between the levels of alignment level tones in mono and stereo modes, may vary in different countries. See:
   a) EBU Techn. SPB 424 (3rd. Ed.)
6.3 **General purpose video input/output**

Values for general purpose video input/output are given in table 3 and in accompanying notes.

|                                                    | 0 to +2 V       |

### NOTES

1. The specified signal voltages should be measured under matched conditions.

2. Difference between peak white level and synchronizing level. Synchronizing level should comply with ITU-R BT.470-4, Table II and III. For the possible effects of non-standard synchronizing level, see IEC 107-6.

3. The values given in the table are the standard peak-to-peak amplitudes of the colour reference burst (for NTSC and PAL) and of the unmodulated D\textsubscript{a} chrominance carrier (for SECAM). The corresponding amplitude for PAL 100/0/100/0 colour bars is 885 mV, and for NTSC 100/7,5/100/7,5 colour bars the amplitude is 835 mV.

4. For the analogue monochrome signals, the difference between any two primary colour signals and other parameters such as Y and vision colour signal shall not exceed 0,5 dB. The peak values of primary colour signals are those that give rise to a peak white luminance signal.

5. The Y\textsuperscript{*} signal consists of the composite signal according to ITU-R Report 624-4 without the burst and chrominance signals or colour subcarrier.

6. The permitted tolerances on the component signal levels should not be applied differentially. For example, a degraded picture quality is likely if the Y\textsuperscript{*} signal level is at the minimum limit of tolerance and the C\textsuperscript{*} signal at the maximum limit.
Matching of microphones and amplifiers

7.1 Microphones (excluding piezoelectric types)

**NOTES**

1. The values of the impedance apply over the frequency range 40 Hz to 16 kHz.

2. In accordance to 11.2 of IEC 268-4.
   a) the values given relate to 0.2 Pa sound pressure (80 dB (20 μPa) sound pressure level);
   b) for close-talking microphones, the rated output voltage is related to 3 Pa sound pressure (104 dB (20 μPa) sound pressure level), and for this class of microphones, the values of output voltage should be 20 dB above those listed;
   c) for electret microphones, the value varies from 0.2 mV to 2.0 mV, dependent on type;
   d) for certain types of highly directional microphones the value may be as high as 100 mV.

3. Values given relate to 100 Pa sound pressure (134 dB (20 μPa) sound pressure level), taking into account a 6 dB higher microphone sensitivity. The requirement for overload source e.m.f. may be met by means of an adjustable attenuator built into the pre-amplifier, preceding the gain control.

4. Values given relate to 10 Pa sound pressure (114 dB (20 μPa) sound pressure level), taking into account a 6 dB higher microphone sensitivity. For mains operated household equipment the values given for broadcasting and sound reinforcement may be required to avoid overload under extreme conditions.
7.2 Microphones with built-in amplifier

These microphones may be equipped with an adjustable attenuator or an electronic gain control circuit.

The output characteristics should comply either with the values for the appropriate type of microphone or those for general purpose output/input of audio equipment (see 6.2).

7.3 Power supply feed for electret microphones fed by a separate conductor

Power supply voltage \( U = 1.5 \text{ V} \) to \( 12 \text{ V} \).

This requirement applies when use is made of the connector 130-9 IEC-20/21, as given in IEC 268-11.

7.4 Phantom supply system

7.4.1 General

In the phantom supply system, both signal conductors have the same d.c. potential. This allows the use of microphone connections either for microphones which do not need a power supply (for example dynamic types), or for microphones having a circuit fed from a separate supply. In either case, it is essential that the amplifier to which the microphone is connected has a balanced floating input.

7.4.2 Supply voltage polarity

The positive pole of the supply voltage shall be connected to the electrical centre of the signal conductors, the negative pole to the screen of the cable.

7.4.3 Circuit diagram

A typical circuit diagram for connection and power supply is given in figure 2. The resistors \( R_1 \) and \( R_2 \) shall be within \( \pm 10 \% \) of their rated value, and shall be matched to within \( \pm 0.4 \% \).

Table 11 gives the required values for voltage and current and typical values for \( R_1 \) and \( R_2 \). Instead of the resistors and/or the transformers shown in the diagrams, other circuit components may be used, provided that the voltage and current requirements given in table 11 are met, and that the balance of the circuit is not disturbed.

NOTE – A centre-tapped transformer fed via a series resistor may be used.

7.4.4 Marking

The supply voltage shall be marked on the microphones using P12, P24, or P48.

If the microphone is designed to operate on more than one supply voltage, this should be indicated by a suitable marking, for example P48/12.

7.4.5 Preferred value of the supply voltage

Although 12 V and 48 V systems are still in use, 24 V systems are preferred for new developments.
7.5 A-B supply system

7.5.1 General

In the A-B supply system, the supply current flows through the signal conductors a and b only (see figure 3). Care should be taken to avoid incorrect operation by switching off the power supply before connecting microphones which do not need a d.c. power supply (for example dynamic types). If not built into the amplifier, suitable series capacitors shall be inserted in order to avoid d.c. magnetization of the input transformer.

7.5.2 Output impedance of the microphone

The output impedance of the microphone shall not exceed 200 Ω within the effective frequency range (40 Hz to 16 kHz).

7.5.3 Circuit diagram

The circuit diagram for connection and power supply is given in figure 3. The resistors \( R_1 \) and \( R_2 \) shall be within ± 10 % of the rated value, but if the power supply is connected to earth (see 7.5.4), they shall be matched to within 1 %.

Table 12 gives the required values for voltage and current and typical values for \( R_1 \) and \( R_2 \).

Instead of the resistors shown in the diagrams, other components may be used, provided they have the equivalent d.c. resistance.

7.5.4 Connection of the power supply to earth

The positive pole A or the negative pole B may be connected to earth.

7.5.5 Marking

Microphones for A-B supply shall be marked with the letters AB.

7.6 Polarity of the audiofrequency voltage

An inward movement of the microphone diaphragm (a positive instantaneous sound pressure) shall produce a positive instantaneous voltage on pin 2 (with respect to pin 3) of the connector according to IEC 268-12, or on pin 1 (with respect to pin 3) of the connector, according to IEC 268-11.

8 Matching of record-playing units (pick-ups) and amplifiers

Matching values for analogue record playing units and amplifiers are given in table 5.
Table 5 – Matching values for analogue record-playing units and amplifiers

NOTES

1. To determine the e.m.f. values given in the table, the following sensitivity ranges for pick-ups have been taken into account:
   - high output: 0,7 mV/cm/s to 2 mV/cm/s;
   - low output: 0,04 mV/cm/s to 0,16 mV/cm/s.

2. High output pick-ups are usually of the moving magnet type and low output pick-ups are usually of the moving coil type.

3. The values are related to a velocity of 7 cm/s and the lower sensitivity limits given in note 1.

4. The values are related to a velocity of 17,5 cm/s and the upper sensitivity limits given in note 1. The maximum output voltage values can be expected in the mid-frequency range between about 700 Hz and 3000 Hz.

4. This value is based on a parallel capacitance of 200 pF for the record-playing unit and its connecting cable, and 220 pF input capacitance of the amplifier.
9.1 *Single unit loudspeakers*

The following values of rated impedance for single unit loudspeakers are preferred: 4 Ω, 8 Ω and 16 Ω.

9.2 *Loudspeaker systems*

9.2.1 *Loudspeakers with built-in amplifier*

A loudspeaker system with a built-in amplifier shall be considered as a power amplifier. The values given in the right-hand part of table 9 apply.

9.2.2 *Impedance-defined loudspeaker systems*

Matching values for impedance defined loudspeaker systems are given in table 6.

**Table 6 – Matching values for impedance-defined loudspeaker systems**

<table>
<thead>

<td>Rated impedance</td>
<td>6 Ω</td>
</tr>
<tr>
<td></td>
<td></td>
<td>8 Ω</td>
</tr>
<tr>
<td></td>
<td></td>
<td>16 Ω</td>
</tr>
</tbody>
</table>

For electrostatic and piezoelectric loudspeakers, the rated impedance shall represent the impedance for correct interconnection, taking into consideration the capacitive character of the load presented to the amplifier.

9.2.3 *Constant voltage loudspeaker systems*

Matching values for voltage defined loudspeaker systems are given in table 7.

**Table 7 – Matching values for constant voltage loudspeaker systems**

</tr>
<tr>
<td></td>
<td></td>
<td>100 V</td>
</tr>
</tbody>
</table>
The lower voltages in the table apply for the common practice of using a larger number of these loudspeakers at reduced power, each loudspeaker covering a smaller area.

NOTE - The rated load impedance $Z$ is calculated from the rated output power $P$ of the amplifier and the line voltage $V$ as given by $Z = \sqrt{P/V}$.

The range of voltages may be extended to higher values for amplifiers designed for long distance distribution of power to a network of loudspeakers; for example, for line broadcasting in residential quarters from a central amplifying station.

9.3 Voltage (or power) matching of amplifiers and loudspeakers

9.3.1 Introduction

In order to achieve optimum matching of amplifiers and loudspeakers, with regard to the intended conditions for use, the following characteristics are specified.

a) Short-term maximum output voltage and power of an amplifier: see IEC 268-3.

b) Short-term maximum input voltage and power of a loudspeaker: see IEC 268-5.

c) Long-term maximum output voltage and power of an amplifier: see IEC 268-3.

d) Long-term maximum input voltage and power of a loudspeaker: see IEC 268-5.

9.3.2 Matching requirements

The matching requirements depend on the condition of operation of the equipment as follows.

In the case of:

a) low probability of incorrect operation leading to clipping of the amplifier (e.g. most hi-fi applications), and where the short-term and the long-term output voltages or powers of the amplifier differ by more than 3 dB:

- the short-term input voltage or power of the loudspeaker shall be greater than or equal to the short-term output voltage or power of the amplifier;
- the long-term input voltage of the loudspeaker shall be greater than or equal to one-half of the long-term output voltage of the amplifier;

NOTE - This implies that the long-term input power of the loudspeaker is greater than one quarter of the long-term output power of the amplifier.

b) low probability of incorrect operation leading to clipping of the amplifier (e.g. most hi-fi applications), and where the short-term and the long-term output voltages or powers of the amplifier are not substantially different (less than 3 dB):

- the long-term input voltage of the loudspeaker shall be greater than or equal to one-half of the long-term output voltage of the amplifier;

NOTE - This implies that the long-term input power of the loudspeaker is greater than one quarter of the long-term output power of the amplifier.

c) significant probability of clipping in the amplifier, (e.g. sound reinforcement and household use) but acoustic feedback or other types of oscillation are not taken into account:

- the long-term input voltage or power of the loudspeaker shall be greater than or equal to the long-term output voltage or power of the amplifier.
9.4 Polarity of the sound pressure

A positive instantaneous voltage at pin 1 with respect to pin 2 of the connector, according to IEC 268-11, shall produce an outward movement of the loudspeaker diaphragm (a positive instantaneous sound pressure).

10 Matching of headphones and amplifiers

This output is designed to produce, as far as possible, a constant sound pressure level in the headphones for a given setting of the volume control, irrespective of the impedance of the headphones over the range 8 Ω to 2000 Ω. The matching values are given in table 8.

Electrostatic headphones equipped with matching units should also comply with the requirements of this clause. Other types of electrostatic headphones are not covered by this standard.

Table 8 – General purpose matching values for headphones and amplifiers

<table>
<thead>
<tr>
<th>Amplifier</th>
<th>Headphones</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output for headphones</td>
<td>Matching values</td>
</tr>
<tr>
<td>Output source impedance (note 1)</td>
<td>120 Ω</td>
</tr>
<tr>
<td>Rated load impedance</td>
<td>8 Ω to 2000 Ω</td>
</tr>
<tr>
<td>Rated source e.m.f.</td>
<td>5 V max. (notes 2 and 3)</td>
</tr>
</tbody>
</table>

NOTES

1. For most types of headphones, the source impedance has very little effect on the performance.

2. For equipment having a low supply voltage, it may not be possible to produce 5 V. If the rated output voltage is less than 5 V, the ability to operate with high impedance headphones is restricted.

3. The 5 V (r.m.s.) represents a maximum signal voltage, on peaks of programme level. Signals at this voltage should not be clipped.

4. The interface is also satisfactory for headphones with rated impedance between 8 Ω and 2000 Ω.

11 Matching of amplifiers to amplifiers

11.1 Pre-amplifiers and power amplifiers for general purpose and sound reinforcement

Matching values for pre-amplifiers and power amplifiers are given in table 9.
Table 9 – Matching values for pre-amplifiers and power amplifiers

<table>
<thead>
<tr>
<th>Pre-amplifier</th>
<th>Power amplifier (note 1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output source impedance</td>
<td>≤ 1 kΩ</td>

</tr>
<tr>
<td>Rated output voltage (note 3)</td>
<td>1 V</td>
</tr>
<tr>
<td>Rated distortion limited output voltage</td>
<td>≥ 3 V</td>
</tr>
</tbody>
</table>

NOTES
1 For power amplifiers which have no volume controls, the rated source e.m.f. is identical to minimum source e.m.f. for rated output voltage and the overload source e.m.f. does not apply.

Power amplifiers, however, may be provided with a volume control. In this case, the overload source e.m.f. should be ≥ 8 V.

2 The rated load impedance shall be 1 kΩ for pre-amplifiers for sound reinforcement. This permits up to 10 power amplifiers to be fed in parallel.

3 Applying the relevant minimum source e.m.f. for rated output voltage to the input of the pre-amplifier, with the gain control at maximum.

11.2 Broadcast and similar line amplifiers

Matching values for broadcast and similar line amplifiers are given in table 10.

Table 10 – Matching values for broadcast and similar line amplifiers

Only the English language text of the International Standard has been retained while adopting it in this Indian Standard.
Bureau of Indian Standards

BIS is a statutory institution established under the *Bureau of Indian Standards Act*, 1986 to promote harmonious development of the activities of standardization, marking and quality certification of goods and attending to connected matters in the country.

Copyright

BIS has the copyright of all its publications. No part of these publications may be reproduced in any form without the prior permission in writing of BIS. This does not preclude the free use, in the course of implementing the standard, of necessary details, such as symbols and sizes, type or grade designations. Enquiries relating to copyright be addressed to the Director (Publications), BIS.

Review of Indian Standards

Amendments are issued to standards as the need arises on the basis of comments. Standards are also reviewed periodically; a standard along with amendments is reaffirmed when such review indicates that no changes are needed; if the review indicates that changes are needed, it is taken up for revision. Users of Indian Standards should ascertain that they are in possession of the latest amendments or edition by referring to the latest issue of ‘BIS Catalogue’ and ‘Standards : Monthly Additions’.

This Indian Standard has been developed from Doc : No. LTD 05 (2022).
