IS 10258 (2002): Sterile Hypodermic Syringes for Single Use
[MHD 12: Hospital Equipment]
Indian Standard

STERILE HYPODERMIC SYRINGES
FOR SINGLE USE
(Second Revision)

ICS 11.040.20
NATIONAL FOREWORD

This Indian Standard (Second Revision) which is identical with ISO 7886-1:1993 'Sterile hypodermic syringes for single use – Part 1: Syringes for manual use' issued by the International Organization for Standardization (ISO) was adopted by the Bureau of Indian Standards on the recommendations of Medical Instruments and Disposable Sectional Committee (MHD 12) and approval of Medical Equipment and Hospital Planning Division Council.

This standard was first published in 1982. It was revised in 1995 to incorporate method of test for carrying out sterility test and to harmonize with ISO 7886-1:1993 to the extent possible. Its second revision has been taken up to align its requirements with ISO 7886-1:1993 and adopt it as a dual number standard. In this standard tests, for toxicity have been replaced by an informative cross-reference to IS 12572 (Part 1): 1994/ISO10993-1:1992 'Biological evaluation of medical devices: Part 1 Guidance on selection of tests (first revision)'.

This standard covers sterile hypodermic syringes intended for single use primarily in humans. It does not specify requirements for freedom from biological hazards. Guidance on biological evaluation and tests relevant to hypodermic syringes are given in IS 12572 (Part 1): 1994/ISO10993-1:1992 and it is suggested that manufacturers take this guidance into account when evaluating products. Such an evaluation should include the effects of the process whereby the needles are sterilized.

Materials to be used for the construction of needles are not specified as their selection will depend to some extent upon the design, process of manufacture and method of sterilization employed by individual manufacturers. Guidance on some aspects of the selection of materials is given in Annex E.

The materials should be compatible with injection fluids. If this is not the case, the attention of the user should be drawn to the exception by labelling the primary container. It is not practicable to specify a universally acceptable test method for incompatibility. However, recommended methods are given in Annex F. These test methods can be regarded only as a means of indicating compatibility. The only conclusive test is that of an individual injection fluid with a specific syringe.

Manufacturers of pharmaceuticals use solvents in injectable preparations. Such solvents should be tested by the manufacturer of the injectable preparation for any possible incompatibility with the materials frequently used in syringe construction. The types of material that have received wide acceptence are included in Annex E. If an incompatibility exists, the injection should be suitably labelled. The impossibility of testing any one injection fluid with all available syringes is recognized and it is strongly recommended that regulatory authorities and relevant trade associations should recognize the problem and take appropriate measures to assist manufacturers.

Hypodermic syringes specified in this standard are intended for use with hypodermic needles specified in IS 10654:2002/ISO 7864:1993 'Sterile hypodermic needles for single use (third revision)'.

Where Indian Pharmacopoeia or other government regulations are legally binding, these requirements may take precedence over this Indian Standard.

Annexes A, B, C and D forms an integral part of this standard. Annexes E, F, G, H and J are for information only.

The text of standard has been approved as suitable for publication as Indian Standard without deviations. Certain conventions are, however, not identical to those used in Indian Standards. Attention is particularly drawn to the following:

a) Wherever the words 'International Standard' appear referring to this standard, they should be read as 'Indian Standard'; and

b) Comma (,) has been used as a decimal marker while in Indian Standards, the current practice is to use a point (.) as the decimal marker.

(Continued on third cover)
Indian Standard
STERILE HYPODERMIC SYRINGES
FOR SINGLE USE
( Second Revision )

1 Scope
This part of ISO 7886 specifies requirements for sterile single-use hypodermic syringes made of plastics materials and intended for the aspiration of fluids or for the injection of fluids immediately after filling.

It excludes syringes for use with insulin (see ISO 8537), single-use syringes made of glass, syringes with needles permanently attached, syringes for use with power-driven syringe pumps, syringes pre-filled with the injection by the manufacturer and syringes supplied with the injection as a kit for filling by a pharmacist.

NOTE 1 A second part of ISO 7886 is being prepared to cover syringes for use with power-driven syringe pumps.

2 Normative references
The following standards contain provisions which, through reference in this text, constitute provisions of this part of ISO 7886. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this part of ISO 7886 are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below. Members of IEC and ISO maintain registers of currently valid International Standards.

ISO 594-1:1986, Conical fittings with a 6 % (Luer) taper for syringes, needles and certain other medical equipment — Part 1: General requirements.

ISO 8601:1988, Data elements and interchange formats — Information interchange — Representation of dates and times.

3 Definitions
For the purposes of this part of ISO 7886, the following definitions apply.

3.1 nominal capacity: Capacity of the syringe as designated by the manufacturer.

NOTE 2 Examples are 1 ml, 5 ml, 50 ml.

3.2 graduated capacity: Volume of water at (20 ± 5)°C [or, for tropical countries (27 ± 5)°C] expelled from the syringe when the fiducial line on the piston traverses a given scale interval or intervals.

3.3 total graduated capacity: Capacity of the syringe at the graduation line furthest from the zero graduation line.

NOTE 3 The total graduated capacity may be equal to, or greater than, the nominal capacity.

3.4 maximum usable capacity: Capacity of the syringe when the piston is drawn back to its furthest functional position.

3.5 fiducial line: Line circumscribing the end of the piston for determining the capacity corresponding to any scale reading of the syringe.

4 Nomenclature
The nomenclature for components of hypodermic syringes for single use is shown in figure 1.
NOTE — The drawing is intended to be illustrative of components of a syringe. The piston/plunger assembly may or may not be of integral construction and may or may not incorporate more than one seal.

Figure 1 — Schematic representation of hypodermic syringe for single use
5 Cleanliness

When inspected by normal or corrected-to-normal vision without magnification under an illuminance of 300 lx to 700 lx, the surface of the hypodermic syringe which comes in contact with injection fluids during normal use shall be free from particles and extraneous matter.

6 Limits for acidity or alkalinity

When determined with a laboratory pH meter and using a general purpose electrode, the pH value of an extract prepared in accordance with annex A shall be within one unit of pH of that of the control fluid.

7 Limits for extractable metals

When tested by a recognized microanalytical method, for example by an atomic absorption method, an extract prepared in accordance with annex A shall, when corrected for the metals content of the control fluid, contain not greater than a combined total of 5 mg/l of lead, tin, zinc and iron. The cadmium content of the extract shall, when corrected for the cadmium content of the control fluid, be lower than 0,1 mg/l.

8 Lubricant

If the interior surfaces of the syringe, including the piston, are lubricated, the lubricant shall not be visible, under normal or corrected-to-normal vision, as droplets or particles.

An acceptable lubricant, applied undiluted, for three-piece syringes is polydimethylsiloxane complying with a national or the European pharmacopoeia. The quantity of lubricant used should not exceed 0,25 mg per square centimetre of the internal surface area of the syringe barrel.

An acceptable lubricant for two-piece syringes is fatty acid amides of erucic and/or oleic acids. The quantity of lubricant should not exceed 0,6 % (m/m) of the mass of the barrel, but attention is drawn to the fact that some national regulations may specify a lower maximum concentration.

9 Tolerance on graduated capacity

The tolerances on the graduated capacity shall be as given in table 1.

</table>
10 Graduated scale

10.1 Scale

10.1.1 The syringe shall have either only one scale or more than one identical scales, which shall be graduated at least at the intervals given in table 1. The unit of volume shall be marked on the barrel.

NOTE 4 This requirement does not preclude the provision of additional graduation marks within the scale or as extensions to the scale.

10.1.2 If the scale is extended beyond the nominal capacity, the extended portion shall be differentiated from the rest of the scale.

Examples of means of differentiation are

a) encircling the scale number of the nominal capacity line;

b) the use of smaller scale numbers for the extra graduation lines;

c) the use of shorter graduation lines for the extra graduation lines;

d) the use of a broken line for the optional vertical line of the extra scale length.

10.1.3 The graduation lines shall be of uniform thickness. They shall lie in planes at right angles to the axis of the barrel.

10.1.4 The graduation lines shall be evenly spaced along the longitudinal axis between the zero graduation line and the line for the total graduated capacity.

10.1.5 When the syringe is held vertically, the ends of all graduation lines of similar length shall be vertically beneath each other.

10.1.6 The lengths of the short graduation lines on each scale shall be approximately half the length of the long lines.

Examples of scales and the numbering of graduation lines are shown in figure 2.

NOTE — The vertical line of the scale may be omitted.

Not to scale.

Figure 2 — Examples of scale graduations
10.2 Numbering of scale

10.2.1 The graduation lines shall be numbered at the volume increments given in table 1. In addition, the line denoting the nominal capacity or the lines denoting the nominal capacity and the total graduated capacity, if these differ, shall be numbered.

Examples of scale numbering are shown in figure 2.

10.2.2 When the syringe is held vertically with the conical tip uppermost and with the scale to the front, the numbers shall appear vertical on the scale and in a position such that they would be bisected by a prolongation of the graduation lines to which they relate. The numbers shall be close to, but shall not touch, the ends of the graduation lines to which they relate.

10.3 Overall length of scale to nominal capacity line

The overall length of the scale shall be as given in table 1.

10.4 Position of scale

When the plunger is fully inserted, that is as near to the nozzle end of the barrel as it will go, the zero graduation line of the scale shall coincide with the fiducial line on the piston to within a quarter of the smallest scale interval.

11 Barrel

11.1 Dimensions

The length of the barrel shall be such that the syringe has a maximum usable capacity of at least 10% more than the nominal capacity.

11.2 Finger grips

The open end of the barrel shall be provided with finger grips that shall ensure that the syringe will not roll more than 180° when it is placed on a flat surface at an angle of 10° to the horizontal. The finger grips shall be free from flash and sharp edges.

Finger grips should be of adequate size, shape and strength for the intended purpose and should enable the syringe to be held securely during use.

12 Piston/plunger assembly

12.1 Design

The design of the plunger and push-button of the syringe shall be such that, when the barrel is held in one hand, the plunger can be depressed by the thumb of that hand. When tested in accordance with annex B, the piston shall not become detached from the plunger.

The plunger should be of a length adequate to allow the piston to traverse the full length of the barrel, but it should not be possible easily to withdraw the plunger completely from the barrel.

The projection of the plunger and the configuration of the push-button should be such as to allow the plunger to be operated without difficulty. When the fiducial line of the piston coincides with the zero graduation line, the preferred minimum length of the plunger from the surface of the finger grips nearer to the push-button should be:

a) 8 mm for syringes of nominal capacity up to but excluding 2 ml;
b) 9 mm for syringes of nominal capacity of 2 ml up to but excluding 5 ml;
c) 12.5 mm for syringes of nominal capacity of 5 ml and greater.

12.2 Fit of piston in barrel

When the syringe is filled with water and held vertically with first one end and then the other end uppermost, the plunger shall not move by reason of its own mass.

NOTE 5 A suggested test method and performance criteria for the forces required to move the plunger are given in annex G. It is recommended that this test be used to generate data on which to decide whether to make this test mandatory in a future revision of this part of ISO 7886.

12.3 Fiducial line

There shall be a visible and defined edge serving as the fiducial line at the end of the piston. The fiducial line shall be in contact with the inner surface of the barrel.

13 Nozzle

13.1 Conical fitting

The male conical fitting of the syringe nozzle shall be in accordance with ISO 594-1.

If the syringe has a locking fitting, it shall be in accordance with ISO 594-2.

13.2 Position of nozzle on end of barrel

13.2.1 On syringes of nominal capacity up to but not including 5 ml, the syringe nozzle shall be situated centrally, i.e., it shall be coaxial with the barrel.
13.2.2 On syringes of nominal capacity 5 ml and
greater, the syringe nozzle shall be situated either
centrally or eccentrically.

13.2.3 If the syringe nozzle is eccentric, its axis shall
be vertically below the axis of the barrel when the
syringe is lying on a flat surface with the scale up-
permost. The distance between the axis of the nozzle
and the nearest point on the internal surface of the
bore of the barrel shall be not greater than 4.5 mm.

13.3 Nozzle lumen

The nozzle lumen shall have a diameter of not less
than 1.2 mm.

14 Performance

14.1 Dead space

When tested in accordance with annex C, the volume
of liquid contained in the barrel and the nozzle when
the piston is fully inserted shall be as given in
table 1.

14.2 Freedom from air and liquid leakage
past piston

When tested in accordance with annex D, there shall
be no leakage of water past the piston or seal(s).
When tested in accordance with annex B, there shall
be no leakage of air past the piston or seal(s), and
there shall be no fall in the manometer reading.

15 Packaging

15.1 Primary container

Each hypodermic syringe shall be sealed in a primary
container.

The materials of the container should not have detri-
mental effects on the contents. The material and de-
gign of the container should be such as to ensure:

a) the maintenance of sterility of the contents under
dry, clean and adequately ventilated storage con-
ditions;

b) the minimum risk of contamination of the contents
during opening of the container and removal of the
contents;

c) adequate protection of the contents during normal
handling, transit and storage;

d) that once opened, the container cannot be easily
resealed, and it should be obvious that the con-
tainer has been opened.

15.2 Secondary container

One or more primary containers shall be packaged in
a secondary container.

The secondary container should be sufficiently robust
to protect the contents during handling, transit and
storage.

One or more secondary containers may be packaged
in a storage and/or transit container.

16 Labelling

16.1 Primary container

The primary container shall be marked with at least
the following information:

a) a description of the contents, including the nomi-
cal capacity and the type of nozzle;

b) the word "STERILE";

c) the words "FOR SINGLE USE" or equivalent (ex-
cepting the term "disposable"); the symbol given
in annex H may also be given;

d) a warning of solvent incompatibility if necessar-
y, for example "Not to be used with paraldehyde"
(see remarks on compatibility given in the intro-
duction);

e) the lot number, prefixed by the word "LOT";

f) the name, trademark, trade name or logo of the
manufacturer or supplier.

16.2 Secondary container

The secondary container shall be marked with at least
the following information:

a) a description of the contents, including the nomi-
cal capacity, the type of nozzle and the number;

b) the word "STERILE";

c) the words "FOR SINGLE USE" or equivalent (ex-
cepting the term "disposable"); the symbol given
in annex H may also be given;

d) a warning to check the integrity of each primary
container before use;

e) the lot number, prefixed by the word "LOT";

f) the date (year and month expressed as specified
in subclause 5.2.1.1 of ISO 8601:1988) of
sterilization (the date of sterilization may be incor-
porated in the first several digits of the lot number); 

\( g \) the name and address of the manufacturer or supplier;

\( h \) information for handling, storage and transportation.

16.3 Storage container

If secondary containers are packaged in a storage container, the storage container shall be marked with at least the following information:

\( a \) a description of the contents as specified in 16.2 \( a \);

\( b \) the lot number, prefixed by the word "LOT";

\( c \) the word "STERILE";

\( d \) the date of sterilization as specified in 16.2 \( f \);

\( e \) the name and address of the manufacturer or supplier;

\( f \) information for handling, storage and transportation of the contents.

16.4 Transport wrapping

If a storage container is not used but the secondary containers are wrapped for transportation, the information required by 16.3 shall either be marked on the wrapping or shall be visible through the wrapping.
Annex A
(normative)

Method for preparation of extracts

A.1 Principle
The syringe is filled with water in order to extract soluble components.

A.2 Apparatus and reagents

A.2.1 Freshly distilled or deionized water, of grade 3 in accordance with ISO 3696.

A.2.2 Selection of laboratory borosilicate glassware.

A.3 Procedure

A.3.1 Fill at least three syringes to the nominal capacity graduation line with water (A.2.1), expel air bubbles, and maintain the syringes at a temperature of (37 ± 2) °C for 8 h ± 5 min.

Eject the contents and combine them in a vessel made of borosilicate glass (A.2.2).

A.3.2 Prepare the control fluid by reserving a portion of the unused water (A.2.1).
Annex B
(normative)

Test method for air leakage past syringe piston during aspiration, and for separation of piston and plunger

B.1 Principle

The syringe nozzle is connected to a reference female conical hub and the syringe partially filled with water. A negative pressure is applied through the nozzle, and the syringe inspected for leakage past the piston and seal(s) and to determine if the piston becomes detached from the plunger.

B.2 Apparatus and reagents

B.2.1 Reference steel female conical fitting, in accordance with ISO 594-1.

B.2.2 Support and device that clamps the syringe plunger, in a fixed position.

B.2.3 Equipment for producing, controlling and measuring vacuum, as shown in figure B.1, comprising a vacuum pump with air bleed control, a manometer and a vacuum-tight valve.

B.2.4 Freshly boiled water, cooled to a temperature of \((20 \pm 5) ^\circ C\).

B.3 Procedure

B.3.1 Draw into the syringe a volume of water (B.2.4) of not less than 25 % of the nominal capacity.

B.3.2 With the nozzle uppermost, withdraw the plunger axially until the fiducial line is at the nominal capacity graduation line and clamp (B.2.2) the plunger in this position as shown in figure B.1.

B.3.3 Connect the syringe nozzle to the reference steel female conical fitting (B.2.1).

B.3.4 Arrange the test equipment (B.2.3) as shown in figure B.1. Switch on the vacuum pump with the air bleed control open.

B.3.5 Adjust the bleed control so that a gradual reduction in pressure is obtained and a manometer reading of 88 kPa\(^{-1}\) below ambient atmospheric pressure is reached.

B.3.6 Examine the syringe for leakage of air past the piston or seal(s).

B.3.7 Isolate the syringe and manometer assembly by means of the vacuum-tight valve.

B.3.8 Observe the manometer reading for \((60 \pm 5) \text{ s}\) and record any fall in the reading.

B.3.9 Examine the syringe to determine if the piston has become detached from the plunger.

B.4 Test report

The test report shall contain at least the following information:

a) the identity and nominal capacity of the syringe;

b) whether leakage past the piston or seal(s) was observed;

c) the fall, if any, in the manometer reading;

d) whether the piston became detached from the plunger;

e) the date of testing.

Figure B.1 — Apparatus for aspiration test
Annex C
(normative)

Method for determination of dead space

C.1 Principle
The syringe is weighed dry and after having been filled with, and emptied of, water. The dead space is inferred from the mass of the residual water.

C.2 Apparatus and reagents
C.2.1 Balance, capable of determining a difference in mass of 0.2 g or less to an accuracy of 7 mg.
C.2.2 Distilled or deionized water, of grade 3 in accordance with ISO 3696.

C.3 Procedure
C.3.1 Weigh (C.2.1) the empty syringe.
C.3.2 Fill the syringe to the nominal capacity graduation line with water (C.2.2), taking care to expel all air bubbles and to ensure that the level of the meniscus of the water coincides with the end of the nozzle lumen.
C.3.3 Expel the water by fully depressing the plunger, and wipe dry the outer surfaces of the syringe.
C.3.4 Reweigh the syringe.

C.4 Calculation of results
Determine the mass, in grams, of water remaining in the syringe by subtracting the mass of the empty syringe from the mass of the syringe after expulsion of the water. Record this value as the dead space in millilitres, taking the density of water as 1 000 kg/m³.

C.5 Test report
The test report shall contain at least the following information:

a) the identity and nominal capacity of the syringe;
b) the dead space, expressed in millilitres;
c) the date of testing.
Annex D
(normative)

Test method for liquid leakage at syringe piston under compression

D.1 Principle
The syringe is filled with water, the syringe nozzle sealed, the plunger arranged in the most disadvantageous orientation in relation to the barrel and a force applied in an attempt to induce leakage past the piston and seal(s).

D.2 Apparatus and reagents

D.2.1 Device for sealing or occluding the syringe nozzle.

NOTE 6 This may comprise the reference steel female conical fitting in accordance with ISO 594-1, suitably sealed or occluded.

D.2.2 Device for applying a sideways force to the syringe plunger, in the range 0.25 N to 3 N.

D.2.3 Device for applying an axial force to the barrel and/or plunger, to generate pressures of 200 kPa and 300 kPa.

D.2.4 Water.

D.3 Procedure

D.3.1 Draw into the syringe a volume of water (D.2.4) exceeding the nominal capacity of the syringe.

D.3.2 Expel air and adjust the volume of water in the syringe to the nominal capacity.

D.3.3 Seal (D.2.1) the syringe nozzle.

D.3.4 Apply a sideways force (D.2.2) to the push-button at right angles to the plunger to swing the plunger radially about the piston seal(s) with a force as given in table 1.

Orientate the plunger to permit the maximum deflection from the axial position.

D.3.5 Apply an axial force (D.2.3) to the syringe so that the pressure given in table 1 is generated by the relative action of the piston and barrel. Maintain the pressure for (30 ±3) s.

D.3.6 Examine the syringe for leakage of water past the piston seal(s).

D.4 Test report
The test report shall contain at least the following information:

a) the identity and nominal capacity of the syringe;

b) whether leakage past the piston or seal(s) was observed;

c) the date of testing.
Annex E
(informative)

Guidance on materials

Materials used in the construction of syringes should be suitable for the process to be used for their sterilization. Attention is drawn to the work in progress in ISO/TC 198 on the sterilization of medical devices.

Materials used in the construction of syringes should not cause them to be detrimentally affected, physically or chemically, by the normal use of injectable preparations.

Certain grades of polypropylene, polystyrene and styrene/acrylonitrile copolymer have been extensively used for the barrels of sterile syringes for hypodermic use. A high-quality natural or synthetic rubber composition is frequently used for the piston, the surface of the piston being lubricated with polydimethylsiloxane. High-density polyethylene is used for the seal of the two-component design in combination with a polypropylene barrel containing an amide slip additive.

Materials used in the construction of the wall of the syringe barrel should have sufficient clarity to enable dosages to be read without difficulty.
Annex F
(informative)

Examples of test methods for incompatibility between syringes and injection fluids

F.1 General

F.1.1 This annex contains a selection of test methods that are recommended for the investigation of the compatibility of syringes with injection fluids. These tests are not yet fully developed and the details of apparatus and methodology have not been finalized; neither have compliance criteria been finalized. This annex should therefore be viewed as being of a provisional nature. Nonetheless, manufacturers are encouraged to perform these tests with a view both to validating the methodology and to producing data that can be used to develop pass/fail criteria. Note that these tests are intended to provide a general assessment, and that the only conclusive test is that of particular injectable preparation with a particular type and brand of syringe.

F.1.2 Three types of tests are given, namely:
— visual/organoleptic (odour) evaluation;
— chemical/physical analysis of syringe extracts (reducing substances, absorption spectra, resistivity);
— evaluation of ease of plunger movement.

F.2 Matrix of tests

A matrix showing which tests are to be performed with each test fluid is shown in Table F.1

F.3 Test fluids

F.3.1 Test fluid A, comprising purified water.

F.3.2 Test fluid B, comprising a solution of ethyl alcohol (analytical grade reagent) in purified water, \( c(C_2H_5OH) = 10.85 \text{ mol/l} \).

F.3.3 Test fluid C, comprising a solution of benzyl alcohol (analytical grade reagent) in purified water, \( c(C_6H_5CH_2OH) = 0.28 \text{ mol/l} \).

F.3.4 Test fluid D, comprising purified water, the resistivity of which has been adjusted to a known value in the range 350 000 \( \Omega \cdot \text{cm} \) to 450 000 \( \Omega \cdot \text{cm} \) by the addition of potassium chloride.

F.4 Apparatus and reagents

F.4.1 Apparatus for volumetric titration, of class B accuracy as specified in ISO 384.

F.4.2 Spectrophotometer and silica cells.

F.4.3 Resistivity meter, having platinum electrodes operating on alternating current so as to avoid polarization effects on the electrodes.

F.4.4 Apparatus to depress syringe plunger, with known, adjustable force.

F.4.5 Stop-watch.

F.4.6 Selection of laboratory borosilicate glassware.

F.4.7 Sulfuric acid, solution in purified water, \( c(H_2SO_4) = 1 \text{ mol/l} \).

F.4.8 Potassium permanganate, solution in purified water, \( c(KMnO_4) = 0.002 \text{ mol/l} \).

F.4.9 Sodium thiosulfate, solution in purified water, \( c(Na_2S_2O_3) = 0.01 \text{ mol/l} \).

F.4.10 Starch indicator solution.

F.4.11 Membrane filter, of pore size not less than 5 \( \mu \text{m} \) and not more than 25 \( \mu \text{m} \), and filter holder.

F.4.12 Balance, capable of weighing from 1 g to 160 g, with an accuracy of 0.1 mg.

F.4.13 Water bath.

F.4.14 Potassium iodide, solid.

F.4.15 Apparatus for clamping syringe.

NOTE 7 All reagents are analytical reagent grade.

F.5 Procedure for preparation of extracts

F.5.1 Fill the requisite number of sterile syringes to the nominal capacity with the selected test fluid. Divide the filled syringes into four equal groups and maintain the syringes and contents under the following conditions:

- Group 1: \((20 \pm 1)^\circ C\) for \((60 \pm 3)\) min
- Group 2: \((20 \pm 1)^\circ C\) for \((24 \pm 1)\) h
- Group 3: \((37 \pm 1)^\circ C\) for \((60 \pm 3)\) min
- Group 4: \((37 \pm 1)^\circ C\) for \((24 \pm 1)\) h

F.5.2 Eject the contents of each group of syringes into a borosilicate glass vessel. Seal the vessel and store at room temperature until required for testing. Do not allow more than 1 h to elapse before testing.

F.6 Test procedures

NOTE 8 Unless otherwise specified, all procedures are to be carried out at \((20 \pm 5)^\circ C\).

F.6.1 Visual examination

F.6.1.1 Procedure

F.6.1.1.1 Filter the requisite quantity of test fluid A (F.3.1) through a membrane filter (F.4.11) and bring the filtrate to a temperature of \((37 \pm 2)^\circ C\).

F.6.1.1.2 Draw into the syringe a volume of filtered test fluid equal to half the nominal capacity and then draw air into the syringe until the fiducial line on the piston is at the nominal capacity graduation line on the scale.

F.6.1.1.3 Shake the syringe vigorously by hand for \((30 \pm 2)\) s. Expel the contents into a borosilicate glass vessel (F.4.6), and examine the fluid under normal or corrected-to-normal vision for the presence of coloration, turbidity and particles. Record the observations.

F.6.1.1.4 Repeat F.6.1.1.2 and F.6.1.1.3.

F.6.1.1.5 Repeat F.6.1.1.1 to F.6.1.1.3 using test fluid B (F.3.2).

F.6.1.2 Proposed compliance criterion

The proposed criterion is that no turbidity, coloration or particles shall be visible in the fluids expelled from the syringe.
F.6.2 Organoleptic (odour) examination

F.6.2.1 Procedure

Proceed as described in F.6.1.1. Compare the odour of the syringe contents (see F.6.1.1.3 and F.6.1.1.5) with that of test fluids A and B and record the observations.

F.6.2.2 Proposed compliance criterion

The proposed criterion is that no difference shall be perceived between the odour of the fluid expelled from the syringe and that of the corresponding test fluid.

F.6.3 Reducing substances

F.6.3.1 Procedure

F.6.3.1.1 Prepare extracts of groups of syringes using test fluid A (F.3.1), as described in F.5.

F.6.3.1.2 Add to a titration flask, by means of the titration apparatus (F.4.1), 20 ml of extract, 2 ml of sulfuric acid (F.4.7) and 20 ml of potassium permanganate solution (F.4.8). Bring the mixture to boiling point (F.4.13) and maintain at this temperature for (180 ± 2) s. Cool the mixture quickly to room temperature.

F.6.3.1.3 Add 1 g of potassium iodide crystals (F.4.14) and 0.25 ml starch indicator solution (F.4.10). Titrate with sodium thiosulfate solution (F.4.9) and record the volume of sodium thiosulfate solution added.

F.6.3.1.4 Repeat F.6.3.1.2 and F.6.3.1.3 using test fluid A in place of the syringe extract. Calculate and report the difference in titres between the test fluid and the syringe extract.

F.6.3.2 Proposed compliance criterion

The proposed criterion is that the difference in titre shall not exceed 0.5 ml between any of the four different extraction conditions.

F.6.4 Spectrophotometry

F.6.4.1 Procedure

F.6.4.1.1 Prepare extracts of groups of syringes using test fluid A (F.3.1) and test fluid B (F.3.2), as described in F.5.

F.6.4.1.2 Record the absorption spectrum of the extract in a spectrophotometer (F.4.2), using silica cells of path length 1 cm, over the range of wavelengths 200 nm to 450 nm.

F.6.4.1.3 Repeat F.6.4.1.2 using test fluid A and test fluid B in place of the syringe extract.

F.6.4.1.4 Examine the control spectrum and the test spectrum of each of the eight different extraction conditions and record differences.

F.6.4.2 Proposed compliance criterion

The proposed criterion is that there shall be no difference in optical density greater than 0.3 between the spectra of the syringe extract and the corresponding test fluid.

F.6.5 Resistivity

F.6.5.1 Procedure

F.6.5.1.1 Prepare extracts of groups of syringes using test fluid D (F.3.4) as described in F.5.

F.6.5.1.2 Measure and record the resistivity of the extract using the resistivity meter (F.4.3).

F.6.5.1.3 Repeat F.6.5.1.2 using test fluid D in place of the syringe extract.

F.6.5.2 Proposed compliance criterion

The proposed criterion is that the resistivity of the syringe extract shall be at least 60% of that of test fluid D.

F.6.6 Ease of plunger movement

F.6.6.1 Procedure

F.6.6.1.1 Fill the requisite number of syringes to the nominal capacity graduation line with test fluid A (F.3.1). Move each plunger to and fro by small amounts so as to ensure it is not adhering to the barrel. Refill each syringe to the nominal capacity graduation line.

F.6.6.1.2 Clamp (F.4.15) each syringe in a vertical position with the tip downwards. After (300 ± 15) s have elapsed since first filling the syringe, apply a force (F.4.4) to the plunger so that the piston ejects the contents. By trial and error, determine the value of the force necessary to eject the contents in a time of (5 ± 2) s.

F.6.6.1.3 Repeat F.6.6.1.1 and F.6.6.1.2 on a total of 10 syringes, and calculate the mean force.

F.6.6.1.4 Repeat F.6.6.1.1 for the requisite number of syringes, using test fluid C (F.3.3) in place of test fluid A.
F.6.6.1.5 Clamp each syringe as described in F.6.6.1.2 and, after (300 ± 15) s have elapsed since first filling, apply to the plunger a force of the mean value determined in F.6.6.1.3. Measure (F.4.5) the time taken for the syringe contents to be ejected.

F.6.6.1.6 Repeat F.6.6.1.5 on a total of 10 syringes and calculate the mean time taken.

F.6.6.1.7 Repeat F.6.6.1.4 to F.6.6.1.6 on syringes that have been filled with test fluid C for a period of (60 ± 3) min.

F.6.6.2 Proposed compliance criterion

The proposed criterion is that the mean time required to expel test fluid A using the force in F.6.6.1.3 shall be at least 50% of that required to expel test fluid C.

F.7 Test report

Report the following:

a) identity of syringe, including nominal capacity;

b) the date of testing;

c) the observations and/or results of each test performed.
Annex G
(informative)

Test method for forces required to operate plunger

G.1 Principle
A mechanical testing machine such as in figure G.1 is used to move the syringe plunger and to aspirate and expel water, whilst the force exerted and the plunger travel are recorded.

G.2 Apparatus and reagents

G.2.1 Mechanical testing machine, capable of measuring and continuously recording force and travel with an accuracy of 1 % of full scale reading, and having means for attaching the syringe to be tested.

G.2.2 Reservoir, open to the atmosphere, and having tubing of inside diameter (2,7 ± 0,1) mm for connecting it to the syringe to be tested.

G.2.3 Water.

G.3 Procedure

G.3.1 Remove the syringe from the package and mount it in the testing machine (G.2.1) as shown in figure G.1. Move the syringe plunger once until the fiducial line reaches the total graduated capacity graduation line, and then return it so that the fiducial line reaches the zero graduation line.

G.3.2 Connect the nozzle of the syringe to the tubing of the reservoir (G.2.2). Add to the reservoir water (G.2.3) at (23 ± 2) °C and displace any air from the tubing. Maintain the water and the syringe at this temperature. Adjust the relative positions of the syringe and reservoir so that the water level in the reservoir is approximately level with the mid-point of the syringe barrel (see figure G.1).

G.3.3 Zero the recorder and set the testing machine (G.2.1) so that it can apply compressive and tensile forces without re-setting.

G.3.4 Start the testing machine so that it withdraws the syringe plunger, at a rate of (100 ± 5) mm/min, to the graduation line that indicates the nominal capacity, thereby drawing water from the reservoir to the syringe.

NOTE 9 The presence of air in the syringe nozzle will not affect the results of the test.

G.3.5 Withdraw the syringe plunger until the fiducial line has reached the nominal capacity graduation line. Stop the plunger travel and readjust the recorder to zero. Wait 30 s. Reverse the testing machine and return the plunger to its original position, thereby expelling the water from the syringe into the reservoir.
1. Jaw of mechanical testing machine (G.2.1)
2. Water level at approximately the mid-point of the syringe
3. Syringe being tested
4. Reservoir (G.2.2)
5. Water (G.2.3)
6. Connecting tubing (G.2.2)
7. Adjustable mounts to accommodate different nominal capacities of syringe

**Figure G.1 — Apparatus for determining forces to operate plunger**
G.4 Calculation of results

G.4.1 From the recording of plunger travel and force applied (see figure G.2), determine the following:

a) the force required \( (F_p) \) to initiate movement of the plunger i.e. the peak force recorded when the testing machine starts to withdraw the plunger (see G.3.4);

b) the mean force \( (\bar{F}) \) during return of the plunger i.e. the estimated or integrated mean value while the testing machine is returning the plunger (see G.3.5);

c) the maximum force \( (F_{max}) \) during return of the plunger (see G.3.5);

d) the minimum force \( (F_{min}) \) during return of the plunger (see G.3.5).

G.4.2 Proposed values for the forces required to operate the plunger are given in table G.1.

G.5 Test report

The test report shall contain at least the following information:

a) the identity and nominal capacity of syringe;

b) the force \( (F_p) \) required to initiate movement of the plunger, expressed in newtons;

c) the mean force \( (\bar{F}) \) during return of the plunger, expressed in newtons;

d) the maximum force \( (F_{max}) \) during return of the plunger, expressed in newtons;

e) the minimum force \( (F_{min}) \) during return of the plunger, expressed in newtons;

f) the date of testing.

Annex H
(informative)

Symbol for "do not re-use"

H.1 General
The ISO symbol to denote equipment intended for single use is ISO symbol registration number ISO 7000/1051, given in ISO 7000.

NOTE 10 Further information on design, dimensions and application of ISO symbols is given in ISO 3461.

H.2 Original design
Symbol ISO 7000/1051 is shown in figure H.1.

The thickness of the lines is 2 mm. Dimension \( a \) is the nominal size of the original design of all ISO symbols and is normally 50 mm. In many cases, including ISO 7000/1051, the actual dimension differs slightly, and the outside diameter of the circle (dimension \( h \)) of the original design is \( 1.16a \), i.e. 58 mm.

No colour is specified in ISO 7000 or in this part of ISO 7886 for symbol 1051.

H.3 Reduction and enlargement of original design
For the application of the symbol it may be necessary to reduce or enlarge the size of the original to a suitable size at which it will actually appear. The nominal dimension \( a \) should be used as a gauge. Practice has shown that dimension \( a \) may be reduced to 3 mm without the symbol losing its legibility. However, the legibility of the symbol when reduced in size should be checked.

\[
\text{\( h = 1.16a \)}
\]

NOTE — The visual centring lines do not form part of the symbol.

<tbody>
<tr>
<td>ISO 594-1:1986</td>
<td>IS 3234 (Part 1):1986 Conical fittings with a 6 percent (Luer) taper for syringes, needles and other medical equipment: Part 1 General requirements (second revision)</td>
<td>Identical</td>
</tr>
</tbody>
</table>

The technical committee responsible for the preparation of this standard has reviewed the provisions of ISO 594-2, ISO 3696 and ISO 8601, referred in this adopted standard, and has decided that they are acceptable for use in conjunction with this standard.

Technical Corrigendum 1 to ISO 7886-1 : 1993 issued in 1995 has been incorporated.

For the purpose of deciding whether a particular requirement of this standard is complied with, the final value, observed or calculated, expressing the result of a test, shall be rounded off in accordance with IS 2 : 1960 ‘Rules for rounding off numerical values (revised)’. The number of significant places retained in the rounded off value should be the same as that of the specified value in this standard.
Bureau of Indian Standards

BIS is a statutory institution established under the Bureau of Indian Standards Act, 1986 to promote harmonious development of the activities of standardization, marking and quality certification of goods and attending to connected matters in the country.

Copyright

BIS has the copyright of all its publications. No part of these publications may be reproduced in any form without the prior permission in writing of BIS. This does not preclude the free use, in the course of implementing the standard, of necessary details, such as symbols and sizes, type or grade designations. Enquiries relating to copyright be addressed to the Director (Publications), BIS.

Review of Indian Standards

Amendments are issued to standards as the need arises on the basis of comments. Standards are also reviewed periodically; a standard along with amendments is reaffirmed when such review indicates that no changes are needed; if the review indicates that changes are needed, it is taken up for revision. Users of Indian Standards should ascertain that they are in possession of the latest amendments or edition by referring to the latest issue of 'BIS Catalogue' and 'Standards: Monthly Additions'.

This Indian Standard has been developed from Doc : No. MHD 12 (2821)
