IS 4132 (2005): Method for calibration of standardized blocks to be used for Brinell hardness testing machines [MTD 3: Mechanical Testing of Metals]
Indian Standard

METHOD FOR CALIBRATION OF STANDARDIZED BLOCKS TO BE USED FOR BRINELL HARDNESS TESTING MACHINES

(Second Revision)

ICS 77.040.10
NATIONAL FOREWORD

This Indian Standard (Second Revision) which is identical with ISO 6506-3:1999 'Metallic materials — Brinell hardness test — Part 3: Calibration of reference blocks' issued by the International Organization for Standardization (ISO) was adopted by the Bureau of Indian Standards on the recommendations of the Mechanical Testing of Metals Sectional Committee and approval of the Metallurgical Engineering Division Council.

This standard was originally published in 1967 and subsequently revised in 1984. This revision of the standard has been taken up to align it with ISO 6506-3:1999 by adoption under dual numbering system.

In this revision, the use of steel balls have been discontinued in favour of carbide balls, to bring it in line with the International practice.

In the adopted standard, some terminology and conventions are, however, not identical to those used in Indian Standard. Attention is especially drawn to the following:

a) Wherever the words 'International Standard' appear referring to this standard, they should be read as 'Indian Standard'.

b) Comma (,) has been used as a decimal marker while in Indian Standards, the current practice is to use a point (.) as the decimal marker.

In this adopted standard, reference appears to certain International Standards for which Indian Standards also exist. The corresponding Indian Standards which are to be substituted in their places are listed below along with their degree equivalence for the editions indicated:

<table>
<thead>
<tr>
<th>International Standard</th>
<th>Corresponding Indian Standard</th>
<th>Degree of Equivalence</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISO 376 Metallic materials — Calibration of force-proving instruments used for the verification of uniaxial testing machines</td>
<td>IS 4169 : 1988 Method for calibration of force-proving instruments used for the verification of uniaxial testing machines (first revision)</td>
<td>Technically equivalent</td>
</tr>
</tbody>
</table>

In reporting the results of a test or analysis made in accordance with this standard, if the final value, observed or calculated, is to be rounded off, it shall be done in accordance with IS 2:1960 'Rules for rounding off numerical values (revised)'.

Indian Standard

METHOD FOR CALIBRATION OF STANDARDIZED BLOCKS TO BE USED FOR BRINELL HARDNESS TESTING MACHINES

(Second Revision)

1 Scope

This part of ISO 6506 specifies a method for the calibration of reference blocks which are intended for use in the indirect verification of Brinell hardness testing machines as described in ISO 6506-2.

2 Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of this part of ISO 6506. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. However, parties to agreements based on this part of ISO 6506 are encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. For undated references, the latest edition of the normative document referred to applies. Members of ISO and IEC maintain registers of currently valid International Standards.

ISO 376, Metallic materials — Calibration of force-proving instruments used for the verification of uniaxial testing machines.

ISO 4287, Geometrical Product Specifications (GPS) — Surface texture: Profile method — Terms, definitions and surface texture parameters.

3 Manufacture of reference blocks

3.1 The block shall be specially manufactured for use as a hardness reference block.

NOTE Attention is drawn to the need to use a manufacturing process which will give the necessary homogeneity, stability of structure and uniformity of surface hardness.

3.2 Each metal block to be calibrated shall be of a thickness no less than

— 16 mm for 10 mm balls;
— 12 mm for 5 mm balls;
— 6 mm for smaller balls.

3.3 The reference blocks shall be free of magnetism. It is recommended that the manufacturer ensure that the blocks, if of steel, have been demagnetized at the end of the manufacturing process.

3.4 The flatness of the two surfaces and the parallelism of the reference block shall be in accordance with Table 1.
### Table 1 — Requirements for the reference blocks

<table>
<thead>
<tr>
<th>Diameter of ball (mm)</th>
<th>Tolerance in flatness of the surfaces (mm)</th>
<th>Tolerance in parallelism (mm on 50 mm)</th>
<th>Permissible surface roughness $R_a$ (μm)</th>

<td>0,02</td>
<td>0,03</td>
<td>Test surface: 0,1, Bottom surface: 0,8</td>
</tr>
</tbody>
</table>

*a Sampling length: $l = 0,8$ mm (see ISO 4287).

3.5 The test surface shall be free from scratches which interfere with the measurement of the indentations (see Table 1).

3.6 To verify that no material is subsequently removed from the reference block, the thickness at the time of calibration shall be marked on it to the nearest 0,1 mm, or an identifying mark shall be made on the test surface (see clause 8).

### 4 Calibration machine

4.1 In addition to fulfilling the general requirements specified in clause 3 of ISO 6506-2:1999, the calibration machine shall also meet the requirements given in 4.2 to 4.8.

4.2 The machine shall be verified directly in intervals not exceeding 12 months. Direct verification involves:

a) calibration of the test force

b) verification of the indenter

c) calibration of the measuring device

d) verification of the testing cycle

4.3 The instruments used for verification and calibration shall be traceable to national standards.

4.4 Each test force shall be correct to within ± 0,1 % of the nominal test force as defined in ISO 6506-1.

The force shall be measured with force-proving instruments of class 0,5 in accordance with ISO 376.

4.5 The indenters shall be verified and shall meet the requirements given in 4.3 of ISO 6506-2:1999 with the exception that the tolerances on the diameter of the balls shall meet requirements given in Table 2.

### Table 2 — Tolerances for different ball diameters

<table>
<thead>
<tr>
<th>Ball diameter (mm)</th>

</tr>
<tr>
<td>2,5</td>
<td>± 0,001</td>
</tr>
<tr>
<td>1</td>
<td>± 0,001</td>
</tr>
</tbody>
</table>
4.6 The scale of the measuring microscope shall be graduated to read to 0,002 mm for indentations made with 10 mm and 5 mm balls and 0,001 mm for indentations made with balls of less than 5 mm diameter.

The scale of the measuring microscope shall be verified by measurements made on a stage micrometer at a minimum of five intervals over each working range. The accuracy of the measuring device in relation to the diameters of indentation shall be as given in Table 3.

<table>
<thead>
<tr>
<th>Diameter of Indentation</th>
<th>Accuracy</th>
</tr>
</thead>
<tbody>
<tr>
<td>$d &lt; 1$</td>
<td>$\pm 0,0005$</td>
</tr>
<tr>
<td>$1 \leq d &lt; 2,5$</td>
<td>$\pm 0,001$</td>
</tr>
<tr>
<td>$d \geq 2,5$</td>
<td>$\pm 0,002$</td>
</tr>
</tbody>
</table>

4.7 The testing cycle shall conform to the testing cycle described in ISO 6506-1 and shall be timed with an uncertainty less than $\pm 0,5$ s.

4.8 The characteristics of the hardmetal balls shall be the following:
- hardness: the hardness shall be no less than 1 500 HV 10, when determined in accordance with ISO 3878;
- density: $\rho = (14,8 \pm 0,2) \text{g/cm}^3$.

NOTE The following chemical composition is recommended:
- tungsten carbide (WC) balance
- total other carbides 2,0 %
- cobalt (Co) 5,0 % to 7,0 %

5 Calibration procedure

The reference blocks shall be calibrated in a calibration machine as described in clause 4, at a temperature of $(23 \pm 5)$ °C, using the general procedure described in ISO 6506-1.

The time from the initial application of force to the time the full test force is reached shall not be less than 6 s nor greater than 8 s. The duration of the test force shall be 10 s to 15 s.

The mechanism which controls the application of the force shall ensure that the speed of approach of the ball immediately before it touches the block is no more than 1 mm/s.

6 Number of indentations

On each reference block, five indentations shall be made uniformly and distributed over the entire test surface.

7 Uniformity of hardness

7.1 Let $d_1, d_2, d_3, d_4, d_5$ be the mean values of the measured diameters of the indentations arranged in increasing order of magnitude.

The uniformity of the block under the particular conditions of calibration is characterized by:

$$d_5 - d_1$$
and expressed in percent of $\bar{d}$

where

$$\bar{d} = \frac{d_1 + d_2 + d_3 + d_4 + d_5}{5}$$

7.2 The maximum permissible value of non-uniformity of a reference block shall be as specified in Table 4.

Table 4 — Maximum permissible value of non-uniformity

<table>
<thead>
<tr>
<th>$\bar{d}$ mm</th>
<th>Maximum permissible value of non-uniformity % of $\bar{d}$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\bar{d} &lt; 0.5$</td>
<td>2.0</td>
</tr>
<tr>
<td>$0.5 \leq \bar{d} \leq 1$</td>
<td>1.5</td>
</tr>
<tr>
<td>$\bar{d} &gt; 1$</td>
<td>1.0</td>
</tr>
</tbody>
</table>

NOTE For a hardness value less than 200 HBW the maximum permissible value of non-uniformity may be 2.0 % of $\bar{d}$.

8 Marking

8.1 Each reference block shall be marked with the following:

a) the arithmetic mean of the hardness values found in the standardizing test, for example: 348 HBW 5/750;
b) the name or mark of the supplier or manufacturer;
c) the serial number;
d) the name or mark of the calibration agency;
e) the thickness of the block or an identifying mark on the test surface (see 3.6);
f) the year of calibration, if not indicated in the serial number.

8.2 Any mark put on the side of the block shall be upright when the test surface is the upper face.

8.3 Each delivered reference block shall be accompanied by a document giving at least the following information:

a) a reference to this standard, i.e. ISO 6506-3;
b) the identity of the block;
c) the date of calibration;
d) the arithmetic mean of the hardness values or the value characterizing the uniformity of the block (see 7.1).

NOTE One of the five indentations may be selected as a reference indentation for the indirect verification of the measuring device as defined in annex A of ISO 6506-2:1999. Therefore, it should be identified with a permanent mark in line with one of the measured diameters.

9 Validity

The hardness reference block is only valid for the scale for which it was calibrated and provided that the block fulfils the requirements of clause 3.

NOTE The calibration validity should be limited to a duration of 5 years.
Bureau of Indian Standards

BIS is a statutory institution established under the Bureau of Indian Standards Act, 1986 to promote harmonious development of the activities of standardization, marking and quality certification of goods and attending to connected matters in the country.

Copyright

BIS has the copyright of all its publications. No part of these publications may be reproduced in any form without the prior permission in writing of BIS. This does not preclude the free use, in the course of implementing the standard, of necessary details, such as symbols and sizes, type or grade designations. Enquiries relating to copyright be addressed to the Director (Publications), BIS.

Review of Indian Standards

Amendments are issued to standards as the need arises on the basis of comments. Standards are also reviewed periodically; a standard along with amendments is reaffirmed when such review indicates that no changes are needed; if the review indicates that changes are needed, it is taken up for revision. Users of Indian Standards should ascertain that they are in possession of the latest amendments or edition by referring to the latest issue of 'BIS Catalogue' and 'Standards : Monthly Additions'.

This Indian Standard has been developed from Doc : No. MTD 3 (4395).
