contains no language declaring or implying that the right of manufacturing the refrigerators should belong, or in any contingency inure, to any other than the partnership to which it was "contributed." It is settled law that a license to use a patent is a personal privilege, which terminates with the life of the individual licensee to which it is granted, unless the grant contains words expressly conferring the power to sell or assign. In the absence of such power, if the licensee be a natural person and dies, or an artificial person or partnership and ceases to exist, the license expires equally in either case. Oliver v. Chemical Co., 109 U. S. 75, 3 Sup. Ct. Rep. 61; Nail Factory v. Corning, 14 How. 193; Gayler v. Wilder, 10 How. 477, 494. When the partnership of Haffcke & Clark was dissolved, the license itself expired, and the exclusive right to the patent remained in the original patentee, unaffected by the temporary license. The subsequent use of it by Clark was an infringement of the patent. The decree of the court below must be reversed, with costs, and the cause remanded to the circuit court of the United States for the district of Maryland, with a direction to enter a decree for the appellant, and for further proceedings in conformity to the opinion of this court. PATENTS FOR INVENTIONS-NOVELTY-ANTICIPATION. Letters patent No. 351.246, issued October 19, 1886, to Herman H. Bothe, were for wagon stake pocket consisting of one piece, rectangular in cross section, having a vertical back, and the remaining sides inwardly inclined, whereby the stake may be held as a wedge requiring no other support. The prior Brownell form of pocket, was of similar shape, made of iron, but was not cast in one piece. A pocket with the tapering sides and front, and vertical back, and cast in one piece, was made for use upon steam cars many years prior to the application for the patent. Held, that the casting in one piece was the only substantial improvement over prior wagon pockets, and this feature was anticipated by those used on steam cars.

Appeal from the Circuit Court of the United States for the Eastern District of Missouri.

In Equity. Bill by Herman H. Bothe against the Paddock-Hawley Iron Company for infringement of letters patent No. 351,246, issued to complainant October 19, 1886, for an improvement in wagon stake pockets. Decree dismissing the bill. Complainant appeals. Affirmed.

Geo. H. Knight and Wm. M. Eccles, for appellant.

W. B. Homer, for appellee.

Before CALDWELL and SANBORN, Circuit Judges, and SHIRAS, District Judge.

SHIRAS, District Judge. Under date of October 19, 1886, letters patent were issued to Herman H. Bothe, the appellant herein, for an improvement in wagon stake pockets, and the bill in the present cause was filed in the circuit court for the eastern district of Missouri for the purpose of restraining the defendant company, the Paddock-Hawley Iron Company, from making, using, or selling stake pockets of the form of those covered by the patent issued to appellant. The answer to the bill denies the validity of the patent for want of novelty, and because the patented article was in public use and on sale by appellant more than two years before the application for the patent was filed. Upon the hearing before the circuit court the defense of want of novelty was sustained, and a decree was entered dismissing the bill, to reverse which the cause was duly appealed to this court.

The first claim in the patent describes the invention as follows:

"A pocket for wagon stakes, rectangular in cross section, having a vertical back, with extensions affording means of attachment to the wagon body, and having its remaining portion—*i. e.*, the front and sides—inclined inwardly, and tending to one common point, by which construction the stake may be held by wedging therein, it having no other support or supports, substantially as set forth."

The stake used with pockets thus constructed is without a shoulder, has a straight back, with tapering sides and front. The pocket is made or cast in a single piece, and it cannot be denied that through compactness of form, ease of attachment to the wagon sill, and the firmness with which the stake is held therein, this form of pocket seems to be superior to the other forms exhibited in the record. On the other hand, no new feature is found therein. In the Brownell form of pocket, which antedates the application for a patent by complainant, are found the tapering sides and front, with a vertical back, all made of iron, but not made in one piece, and in this particular the Bothe form unquestionably is a great improvement over the Brownell pocket. It appears, however, from the testimony of Hoyt H. Green, that pockets having a straight back with tapering sides and front were cast in one piece for use upon steam cars many years before Bothe applied for his patent, so that it does not appear that there is novelty in this feature of the Bothe pocket, and yet this is the special feature which gives it superiority over the Brownell form. Under these circumstances it cannot be said that there was patentable novelty in applying the idea of casting the pocket in one piece. From the statements found in the specifications accompanying the application filed by complainant, it does not appear that he relied on this feature as the novel one in his combination, and yet, if that is eliminated, it does not appear that there is any substantial difference between the Bothe and Brownell pockets. In our judgment, it is the fact that the Bothe pocket is cast in one piece that gives it superiority over the Brownell pocket; but, this not being a novel feature in the manufacture of stake pockets, the patent to Bothe cannot be sustained because that element is found therein. The finding and decree of the circuit court are therefore affirmed at costs of appellant.

-rad all the investig is the end of the end of the interimet of it is the part of the part HOLL GLEMENT MANUF'S Co. et al. v. Upson & HART Co. et al. to much out to machine where not the normal and particles much . . in only of a my (Circuit Court, D. Connectiout. May 26, 1892.) odd samaad lane , where n' is 's No. 681. I have self it to PATENTS FOR INVENTIONS INVENTION TOBULAR HANDLED TOOLS. Letters patent No. 941,821, issued May 17, 1881, to James Beecher, for an improve-ment in the manufacture of cutlery and tools, consisting in simultaneously welding a tubular handle to a blade, and closing up the opposite end of the handle by forg-ling between dies, presences patentable invention.

SAME-INFRINGEMENT.

SAME-INFRINGEMENT. In the Beecher patent the handle was formed of a rectangular plate, which was formedrinto a cylinder, the joint being welded. This was then raised to a welding heat, and placed between dies, so that the blow of the hammer produced a lap weld at the end of the handle. Defendant used a plate having lobes or projections at the end of the handle. Defendant used a plate having lobes or projections at the end of the bandle in the acylinder, these lobes were bent inwards, institute dies were so constructed that in operating, upon this formation they pro-duced a buttweld. *Heid*, that the processes were radically different, and there was no intringement.

Dismissed. In Equity. Bill for infringement of patents. For prior opinions respecting the patents in litigation, see 40 Fed. Rep. 471, 42 Fed. Rep. 530; 43 Fed. Rep. 670.

SHIPMAN, Circuit Judge. This is a bill in equity, which is based upon the alleged infringement of letters patent No. 241,471, dated May 17, 1881, to James Beecher, for an improvement in the manufacture of cutlery and tools, and of letters patent No. 368,061, dated August 9, 1887, to Henry A. Brognard, for improvements in the manufacture of hardware having hollow handles. Before the date of the Beecher invention,----which was at least as early as May, 1879,---the butt ends of the hollow handles of cutlery had been closed up or welded by striking the ends with a cupping die, the blade being welded to the other end of the tubular handle at a prior or subsequent operation. Hollow-handled cutlery had not been formed by simultaneously welding a tubular handie to a blade and closing up the opposite or butt end of the handle, the simultaneous operation being performed by forging between dies. The general object of the Beecher invention was to do this thing. The invention is described by the patentee in his specification as follows, omitting the references to the drawings: a days a loss of orthogonal

"I provide a rectangular blank of sheet iron, which I form over a mandrel, and weld up into an open-ended tube, corresponding substantially in cross section with that desired for the handle. The blank is of sufficient size to make one handle only. * * * The steel blade is of the ordinary construcmake one handle only. tion, and is provided with a short longitudinal projection or tang at its end nearest the handle, by which it is united thereto, as presently to be described. The tabular handle and blads, having been raised to a proper welding heat in a furnace, are then removed therefrom. The tang of the blade is inserted into one of the open ends of the handle, and the handle and blade are placed between a pair of forming dies, the conformation of which corresponds with that desired for the handle, and the concavity of which is of slightly less length than the partially formed handle. The application of the impact of a drop hammer to the dies and the contained blade and handle is then made,
