REVISION RECORD FOR THE
STATE OF CALIFORNIA

EMERGENCY SUPPLEMENT

January 1, 2008

2007 Title 24, Part 2, California Building Code

PLEASE NOTE: The date of this errata is for identification purposes only.
See the History Note Appendix for the adoption and effective dates of the provisions.

It is suggested that the section number as well as the page number be checked when inserting this material and removing the superseded material. In case of doubt, rely on the section numbers rather than the page numbers because the section numbers must run consecutively.

It is further suggested that the material be retained with this revision record sheet so that the prior wording of any section can be easily ascertained.

Please keep the removed pages with this revision page for future reference.

Note

Due to the fact that the application date for a building permit establishes the California Building Standards Code provisions that are effective at the local level, which apply to the plans, specifications, and construction for that permit, it is strongly recommended that the removed pages be retained for historical reference.

Item No. 5519S002
1607A.5 Partition loads. In office buildings and in other buildings where partition locations are subject to change, provisions for partition weight shall be made, whether or not partitions are shown on the construction documents, unless the specified live load exceeds 80 psf (3.83 kN/m²). The partition load shall not be less than a uniformly distributed live load of 15 psf (0.74 kN/m²).

1607A.6 Truck and bus garages. Minimum live loads for garages having trucks or buses shall be as specified in Table 1607A 6, but shall not be less than 50 psf (2.40 kN/m²), unless other loads are specifically justified and approved by the building official. Actual loads shall be used where they are greater than the loads specified in the table.

<tr>
<td>H15-44 and H15-44</td>
</tr>
</tbody>
</table>

For SI: 1 pound per linear foot = 0.01459 kN/m, 1 pound = 0.004448 kN, 1 ton = 8.90 kN

a. An H loading class designates a two-axle truck with a semitrailer. An HS loading class designates a tractor truck with a semitrailer. The numbers following the letter classification indicate the gross weight in tons of the standard truck and the year the loadings were instituted.
b. See Section 1607A.6.1 for the loading of multiple spans.

1607A.6.1 Truck and bus garage live load application. The concentrated load and uniform load shall be uniformly distributed over a 10-foot (3048 mm) width on a line normal to the centerline of the lane placed within a 12-foot-wide (3658 mm) lane. The loads shall be placed within their individual lanes so as to produce the maximum stress in each structural member. Single spans shall be designed for the uniform load in Table 1607A.6 and one simultaneous concentrated load positioned to produce the maximum effect. Multiple spans shall be designed for the uniform load in Table 1607A.6 on the spans and two simultaneous concentrated loads in two spans positioned to produce the maximum negative moment effect. Multiple span design loads, for other effects, shall be the same as for single spans.

1607A.7 Loads on handrails, guards, grab bars, shower seats, dressing room bench seats, and vehicle barriers. Handrails, guards, grab bars and vehicle barriers shall be designed and constructed to the structural loading conditions set forth in this section.

1607A.7.1 Handrails and guards. Handrail assemblies and guards shall be designed to resist a load of 50 plf (0.73 kN/m) applied in any direction at the top and to transfer this load through the supports to the structure. Glass handrail assemblies and guards shall also comply with Section 2407.

Exceptions:

1. For one- and two-family dwellings, only the single concentrated load required by Section 1607A.7.1 shall be applied.

2. In Group I-3, F, H and S occupancies, for areas that are not accessible to the general public and that have an occupant load less than 50, the minimum load shall be 20 pounds per foot (0.29 kN/m).

1607A.7.1.1 Concentrated load. Handrail assemblies and guards shall be able to resist a single concentrated load of 200 pounds (0.89 kN), applied in any direction at any point along the top, and have attachment devices and supporting structure to transfer this loading to appropriate structural elements of the building. This load need not be assumed to act concurrently with the loads specified in the preceding paragraph.

1607A.7.1.2 Components. Intermediate rails (all those except the handrail), balusters, and panel fillers shall be designed to withstand a horizontally applied normal load of 50 pounds (0.22 kN) on an area equal to 1 square foot (0.093 m²), including openings and space between rails. Reactions due to this loading are not required to be superimposed with those of Section 1607A.7.1 or 1607A.7.1.1.

1607A.7.1.3 Stress increase. Where handrails and guards are designed in accordance with the provisions for allowable stress design (working stress design) exclusively for the loads specified in Section 1607A.7.1, the allowable stress for the members and their attachments are permitted to be increased by one-third.

1607A.7.2 Grab bars, shower seats and dressing room bench seats. Grab bars, shower seats and dressing room bench seat systems shall be designed to resist a single concentrated load of 250 pounds (1.11 kN) applied in any direction at any point. See Chapter 11A, Section 1127A.4, and Chapter 11B, Sections 1115B.7.2 and 1117B.8, for grab bars, shower seats and dressing room bench seats, as applicable.

1607A.7.3 Vehicle barriers. Vehicle barrier systems for passenger cars shall be designed to resist a single load of 6,000 pounds (26.70 kN) applied horizontally in any direction to the barrier system and shall have anchorage or attachment capable of transmitting this load to the structure. For design of the system, the load shall be assumed to act at a minimum height of 1 foot, 6 inches (457 mm) above the floor or ramp surface on an area not to exceed 1 square foot (305 mm²), and is not required to be assumed to act concurrently with any handrail or guard loadings specified in the preceding paragraphs of Section 1607A.7.1. Garages accommodating trucks and buses shall be designed in accordance with an approved method that contains provision for traffic railings.

1607A.8 Impact loads. The live loads specified in Section 1607A.3 include allowance for impact conditions. Provisions shall be made in the structural design for uses and loads that involve unusual vibration and impact forces.

1607A.8.1 Elevators. Elevator loads shall be increased by 100 percent for impact and the structural supports shall be designed within the limits of deflection prescribed by ASME A17.1.
1607A.8.2 Machinery. For the purpose of design, the weight of machinery and moving loads shall be increased as follows to allow for impact: (1) elevator machinery, 100 percent; (2) light machinery, shaft- or motor-driven, 20 percent; (3) reciprocating machinery or power-driven units, 50 percent; (4) hangers for floors or balconies, 33 percent. Percentages shall be increased where specified by the manufacturer.

1607A.9 Reduction in live loads. Except for roof uniform live loads, all other minimum uniformly distributed live loads, \( L_{u} \), in Table 1607A.1 are permitted to be reduced in accordance with Section 1607A.9.1 or 1607A.9.2.

1607A.9.1 General. Subject to the limitations of Sections 1607A.9.1.1 through 1607A.9.1.4, members for which a value of \( K_{ul}A_{t} \) is 400 square feet (37.16 m²) or more are permitted to be designed for a reduced live load in accordance with the following equation:

\[
L = L_{a} \left( 0.25 + \frac{15}{\sqrt{K_{ul}A_{t}}} \right) \quad \text{(Equation 16A-24)}
\]

For SI: \( L = L_{a} \left( 0.25 + \frac{457}{\sqrt{K_{ul}A_{t}}} \right) \)

where:

\( L \) = Reduced design live load per square foot (meter) of area supported by the member.

\( L_{a} \) = Unreduced design live load per square foot (meter) of area supported by the member (see Table 1607A.1).

\( K_{ul} \) = Live load element factor (see Table 1607A.9.1).

\( A_{t} \) = Tributary area, in square feet (square meters) \( L \) shall not be less than 0.50 \( L_{a} \) for members supporting one floor and \( L \) shall not be less than 0.40 \( L_{a} \) for members supporting two or more floors.

</tbody>
</table>

1607A.9.1.1 Heavy live loads. Live loads that exceed 100 psf (4.79 kN/m²) shall not be reduced.

Exceptions:
1. The live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent, but the live load shall not be less than \( L \) as calculated in Section 1607A.9.1.

2. For uses other than storage, where approved, additional live load reductions shall be permitted where shown by the registered design professional that a rational approach has been used and that such reductions are warranted.

1607A.9.1.2 Passenger vehicle garages. The live loads shall not be reduced in passenger vehicle garages except the live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent, but the live load shall not be less than \( L \) as calculated in Section 1607A.9.1.

1607A.9.1.3 Special occupancies. Live loads of 100 psf (4.79 kN/m²) or less shall not be reduced in public assembly occupancies.

1607A.9.1.4 Special structural elements. Live loads shall not be reduced for one-way slabs except as permitted in Section 1607A.9.1.1. Live loads of 100 psf (4.79 kN/m²) or less shall not be reduced for roof members except as specified in Section 1607A.11.2.

1607A.9.2 Alternate floor live load reduction. As an alternative to Section 1607A.9.1, floor live loads are permitted to be reduced in accordance with the following provisions. Such reductions shall apply to slab systems, beams, girders, columns, piers, walls and foundations.

1. A reduction shall not be permitted in Group A occupancies.

2. A reduction shall not be permitted where the live load exceeds 100 psf (4.79 kN/m²) except that the design live load for members supporting two or more floors is permitted to be reduced by 20 percent.

3. A reduction shall not be permitted in passenger vehicle parking garages except that the live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent.

4. For live loads not exceeding 100 psf (4.79 kN/m²), the design live load for any structural member supporting 150 square feet (13.94 m²) or more is permitted to be reduced in accordance with the following equation:

\[
R = 0.08 \left( A - 150 \right) \quad \text{(Equation 16A-25)}
\]

For SI: \( R = 0.861 \left( A - 1394 \right) \)

Such reduction shall not exceed the smallest of:

1. 40 percent for horizontal members;
2. 60 percent for vertical members; or
3. \( R \) as determined by the following equation

\[
R = 23.1 \left( 1 + \frac{D}{L_{o}} \right) \quad \text{(Equation 16A-26)}
\]

where:

\( A \) = Area of floor supported by the member, square feet (m²).

\( D \) = Dead load per square foot (m²) of area supported.
2. Where the exception to Section 20.3.1 is applicable except for base isolated buildings.

A. BUILDING FRAME SYSTEMS

B. BUILDING FRAME SYSTEMS

14. Light-framed walls with shear panels of all other materials—Not permitted by OSHPD and DSA-SS.

15. Ordinary steel concentrically braced frames—Not permitted by OSHPD.

24. Light-framed walls with shear panels of all other materials—Not permitted by OSHPD and DSA-SS.

25. Buckling-restrained braced frames, nonmoment-resisting beam-column connections—Not permitted by OSHPD.

27. Special steel plate shear wall—Not permitted by OSHPD.

C. MOMENT-RESISTING FRAME SYSTEMS

2. Special steel truss moment frames—Not permitted by OSHPD.

3. Intermediate steel moment frames—Not permitted by OSHPD.

4. Ordinary steel moment frames—Not permitted by OSHPD.

Exceptions:

1. Systems listed in this section can be used as an alternative system when preapproved by the enforcement agency.

2. Roof top or other supported structures not exceeding two stories in height and 10 percent of the total structure weight can use the systems in this section when designed as components per ASCE 7 Chapter 13

3. Systems listed in this section can be used for seismically isolated buildings when permitted by Section 1613A.6.2.

1614A.1.4 ASCE 7, Section 12.2.3.1. Modify ASCE 7 Section 12.2.3.1 by adding the following additional requirements for two stage equivalent lateral force procedures:

e. Where design of elements of the upper portion is governed by special seismic load combinations, the special loads shall be considered in the design of lower portions.

f. The detailing requirements required for the lateral system of the upper portion shall be used for structural components common to the structural system of the lower portion.

g. If separate models are used to design the upper and lower portions, the model boundary conditions of the upper portion shall be compatible with actual strength and stiffness of the supporting elements of the lower portion.

h. Both flexible upper portion and rigid lower portion considered separately can be classified as being regular.

Exception: When dynamic analysis is used, regularity requirements in Item h above need not apply.

1614A.1.5 ASCE 7, Section 12.3.3. Modify first sentence of Section 7 Section 12.3.3.1 as follows:

12.3.3.1 Prohibited horizontal and vertical irregularities for Seismic Design Categories D through F. Structures assigned to Seismic Design Category D, E or F having horizontal structural irregularity Type 1b of Table 12.3.1 or vertical structural irregularities Type 1b, 5a or 5b of Table 12.3.2 shall not be permitted.

1614A.1.6 ASCE 7, Section 12.7.2. Modify ASCE 7 Section 12.7.2 by adding Item 5 to read as follows:

5. Where buildings provide lateral support for walls retaining earth, and the exterior grades on opposite sides of the building differ by more than 6 feet (1829 mm), the load combination of the seismic increment of earth pressure due to earthquake acting on the higher side, as determined by a geotechnical engineer qualified in soils engineering plus the difference in earth pressures shall be added to the lateral forces provided in this section.

1614A.1.7 ASCE 7, Section 12.8.1.1. Modify ASCE 7 Section 12.8.1.1 by replacing Equation 12.8-5 as follows:

\[ C_s = 0.03 \]  

(12.8-5)

1614A.1.8 ASCE 7, Section 12.8.7. Modify ASCE 7 Section 12.8.7 by replacing Equation 12.8-16 as follows:

\[ \theta = \frac{P_x \Delta f}{V_{h,a} C_a} \]  

(12.8-16)

1614A.1.9 ASCE 7, Section 12.9.4. Replace ASCE 7 Section 12.9.4 as follows:

12.9.4 Scaling design values of combined response. Modal base shear shall not be less than the base shear calculated using the equivalent lateral force procedure of Section 12.8.

1614A.1.10 ASCE 7, Section 12.13.1. Modify ASCE 7 Section 12.13.1 by adding Section 12.13.1.1 as follows:

12.13.1.1 Foundations and superstructure-to-foundation connections. The foundation shall be capable of
transmitting the design base shear and the overturning forces from the structure into the supporting soil.

In addition, the foundation and the connection of the superstructure elements to the foundation shall have the strength to resist, in addition to gravity loads, the lesser of the following seismic loads:

1. The strength of the superstructure elements.
2. The maximum forces that would occur in the fully yielded structural system.
3. Forces from load combinations with overstrength factor per ASCE 7 Section 12.4.3.2.

Exceptions:

1. Where structures are designed using \( R \leq 2.5 \) such as for inverted pendulum-type structures.
2. When it can be demonstrated that inelastic deformation of the foundation and superstructure-to-foundation connection will not result in a weak story or cause collapse of the structure.
3. Where the basic structural system consists of light-framed walls with shear panels.

Where the computation of the seismic overturning moment is by the equivalent lateral-force method or the modal analysis method, reduction in overturning moment permitted by Section 12.13.4 of ASCE 7 may be used.

Where moment resistance is assumed at the base of the superstructure elements, the rotation and flexural deformation of the foundation as well as deformation of the superstructure-to-foundation connection shall be considered in the drift and deformation compatibility analyses.

Exception: The seismic loads defined above need not be considered for friction and passive resistance. Ultimate soil pressure can be used when considering load combinations with the seismic loads defined above.

1614A.1.11 ASCE 7, Section 13.3.2. Modify ASCE 7 Section 13.3.2 by adding the following:

The seismic relative displacements to be used in design of displacement sensitive nonstructural components is \( D_s T \) instead of \( D_s \), where \( D_s \) is given by Equations 13.3-3 to 13.3-8 and \( T \) is the building importance factor given in Section 11.5.

1614A.1.12 ASCE 7, Section 13.5.6.2. Modify ASCE 7 Section 13.5.6.2 by adding Section 13.5.6.2.3 as follows.

13.5.6.2.3 Additional requirements

1. Exitways. Lay-in ceiling assemblies in exitways of hospitals and essential services buildings shall be installed with a main runner or cross runner surrounding all sides of each piece of tile, board or panel and each light fixture or grille. A cross runner that supports another cross runner shall be considered as a main runner for the purpose of structural classification. Splices or intersections of such runners shall be attached with through connectors such as pop rivets, screws, pins, plates with end tabs or other approved connectors.

2. Corridors and lobbies. Expansion joints shall be provided in the ceiling at intersections of corridors and at junctions of corridors and lobbies or other similar areas.

3. Lay-in panels. Metal panels and panels weighing more than \( 1/2 \) pound per square foot (24 N/m²) other than acoustical tiles shall be positively attached to the ceiling suspension runners.

4. Grid members, connectors and expansion devices. The allowable load-carrying capacity as determined by test shall not exceed one-third of the mean ultimate test value based on tests of no fewer than three identical specimens. Rational analysis can be substituted for test where permitted by ASCE 7 and the enforcement agency.

5. Vertical hangers. Each vertical hanger shall be attached to the ceiling suspension member and to the support above with a minimum of three tight twists in \( 1/4 \) inch (38 mm).

6a. [OSHPD 1 & 4] Lateral-force bracing. Substantiating design calculations or test reports shall be provided for all lateral-force bracing, their connections and anchorages. Lateral forces must comply with the seismic force requirements of ASCE 7 Chapter 13. Horizontal restraint points shall not be placed more than 8 feet by 12 feet (2438 mm by 3658 mm) on center. Horizontal restraint wires shall be No 12 gage minimum and secured to main runners with four tight twists in \( 1/4 \) inch (38 mm).

6b. [DSA-SS] Lateral-force bracing. Substantiating design calculations or test reports shall be provided for all lateral-force bracing, their connections and anchorages. Lateral forces must comply with the seismic force requirements of ASCE 7 Chapter 13. Horizontal restraint points shall not be placed more than 12 feet by 12 feet (3658 mm by 3658 mm) on center. Horizontal restraint wires shall be No. 12 gage minimum and secured to main runners with four tight twists in \( 1/4 \) inch.

7. Ceiling fixtures. Fixtures installed in acoustical tile or lay-in panel ceilings shall be mounted in a manner that will not compromise ceiling performance.

All recessed or drop-in light fixtures and grilles shall be supported directly from the fixture housing to the structure above with a minimum of two 12-gage wires located at diagonally opposite corners. Leveling and positioning of fuc-

</table>

For SI: 1 inch = 25.4 mm.

⁴ Where applicable, see also Section 1707A 1, Special inspection for seismic resistance.
1704A.3.3 High-strength bolts. Installation of high-strength bolts shall be periodically inspected in accordance with AISC specifications.

1704A.3.3.1 General. While the work is in progress, the special inspector shall determine that the requirements for bolts, nuts, washers and paint; bolted parts and installation and tightening in such standards are met. For bolts requiring pretensioning, the special inspector shall observe the preinstallation testing and calibration procedures when such procedures are required by the installation method or by project plans or specifications; determine that all plies of connected materials have been drawn together and properly snugged and monitor the installation of bolts to verify that the selected procedure for installation is properly used to tighten bolts. For joints required to be tightened only to the snug-tight condition, the special inspector need only verify that the connected materials have been drawn together and properly snugged.

1704A.3.3.2 Periodic monitoring. Monitoring of bolt installation for pretensioning is permitted to be performed on a periodic basis when using the turn-of-nut method with matchmarking techniques, the direct tension indicator method or the alternate design fastener (twist-off bolt) method. Joints designated as snug tight need be inspected only on a periodic basis.

1704A.3.3.3 Continuous monitoring. Monitoring of bolt installation for pretensioning using the calibrated wrench method or the turn-of-nut method without matchmarking shall be performed on a continuous basis.

1704A.4 Concrete construction. The special inspections and verifications for concrete construction shall be as required by this section and Table 1704A.4.

1704A.4.1 Materials. In the absence of sufficient data or documentation providing evidence of conformance to quality standards for materials in Chapter 3 of ACI 318, the building official shall require testing of materials in accordance with the appropriate standards and criteria for the material in Chapter 3 of ACI 318. Weldability of reinforcement, except that which conforms to ASTM A 706, shall be determined in accordance with the requirements of Section 3 5.2 of ACI 318.

a Where applicable, see also Section 1707A 1 Special inspection for seismic resistance

110 2007 CALIFORNIA BUILDING CODE
ment determines that the load-bearing capacity is less than that required by the code, load tests shall be conducted in accordance with Section 1713A.2. If the building, structure or portion thereof is found to have inadequate stability or load-bearing capacity for the expected loads, modifications to ensure structural adequacy or the removal of the inadequate construction shall be required.

1713A.2 Test standards. Structural components and assemblies shall be tested in accordance with the appropriate material standards listed in Chapter 35. In the absence of a standard that contains an applicable load test procedure, the test procedure shall be developed by a registered design professional and approved. The test procedure shall simulate loads and conditions of application that the completed structure or portion thereof will be subjected to in normal use.

1713A.3 In-situ load tests. In-situ load tests shall be conducted in accordance with Section 1713A.3.1 or 1713A.3.2 and shall be supervised by a registered design professional. The test shall simulate the applicable loading conditions specified in Chapter 16A as necessary to address the concerns regarding structural stability of the building, structure or portion thereof.

1713A.3.1 Load test procedure specified. Where a standard listed in Chapter 35 contains an applicable load test procedure and acceptance criteria, the test procedure and acceptance criteria in the standard shall apply. In the absence of specific load factors or acceptance criteria, the load factors and acceptance criteria in Section 1713A.3.2 shall apply.

1713A.3.2 Load test procedure not specified. In the absence of applicable load test procedures contained within a standard referenced by this code or acceptance criteria for a specific material or method of construction, such existing structure shall be subjected to a test procedure developed by a registered design professional that simulates applicable loading and deformation conditions. For components that are not a part of the seismic-load-resisting system, the test load shall be equal to two times the unfactored design loads. The test load shall be left in place for a period of 24 hours. The structure shall be considered to have successfully met the test requirements where the following criteria are satisfied:

1. Under the design load, the deflection shall not exceed the limitations specified in Section 1604A.3.
2. Within 24 hours after removal of the test load, the structure shall have recovered not less than 75 percent of the maximum deflection.
3. During and immediately after the test, the structure shall not show evidence of failure.

SECTION 1714A
PRECONSTRUCTION LOAD TESTS

1714A.1 General. In evaluating the physical properties of materials and methods of construction that are not capable of being designed by approved engineering analysis or do not comply with applicable material design standards listed in Chapter 35, the structural adequacy shall be predetermined based on the load test criteria established in this section.

1714A.2 Load test procedures specified. Where specific load test procedures, load factors and acceptance criteria are included in the applicable design standards listed in Chapter 35, such test procedures, load factors and acceptance criteria shall apply. In the absence of specific test procedures, load factors or acceptance criteria, the corresponding provisions in Section 1714A.3 shall apply.

1714A.3 Load test procedures not specified. Where load test procedures are not specified in the applicable design standards listed in Chapter 35, the load-bearing and deformation capacity of structural components and assemblies shall be determined on the basis of a test procedure developed by a registered design professional that simulates applicable loading and deformation conditions. For components and assemblies that are not a part of the seismic-load-resisting system, the test shall be as specified in Section 1714A.3.1. Load tests shall simulate the applicable loading conditions specified in Chapter 16A.

1714A.3.1 Test procedure. The test assembly shall be subjected to an increasing superimposed load equal to not less than two times the superimposed design load. The test load shall be left in place for a period of 24 hours. The test assembly shall be considered to have successfully met the test requirements if the assembly recovers not less than 75 percent of the maximum deflection within 24 hours after the removal of the test load. The test assembly shall then be reloaded and subjected to an increasing superimposed load until the structural failure occurs or the superimposed load is equal to two and one-half times the load at which the deflection limitations specified in Section 1714A.3.2 were reached, or the load is equal to two and one-half times the superimposed design load. In the case of structural components and assemblies for which deflection limitations are not specified in Section 1714A.3.2, the test specimen shall be subjected to an increasing superimposed load until structural failure occurs or the load is equal to two and one-half times the desired superimposed design load. The allowable superimposed design load shall be taken as the lesser of:

1. The load at the deflection limitation given in Section 1714A.3.2.
2. The failure load divided by 2.5.
3. The maximum load applied divided by 2.5.

1714A.3.2 Deflection. The deflection of structural members under the design load shall not exceed the limitations in Section 1604A.3.

1714A.4 Wall and partition assemblies. Load-bearing wall and partition assemblies shall sustain the test load both with and without window framing. The test load shall include all design load components. Wall and partition assemblies shall be tested both with and without door and window framing.

1714A.5 Exterior window and door assemblies. The design pressure rating of exterior windows and doors in buildings shall be determined in accordance with Section 1714A.5.1 or 1714A.5.2.

Exception: Structural wind load design pressures for window units smaller than the size tested in accordance with Section 1714A.5.1 or 1714A.5.2 shall be permitted to be higher than the design value of the tested unit provided such
higher pressures are determined by accepted engineering analysis. All components of the small unit shall be the same as the tested unit. Where such calculated design pressures are used, they shall be validated by an additional test of the window unit having the highest allowable design pressure.

1714A.5.1 Exterior windows and doors. Exterior windows and sliding doors shall be tested and labeled as conforming to AAMA/WDMA/CSA101/L.S 2/A440. The label shall state the name of the manufacturer, the approved labeling agency and the product designation as specified in AAMA/WDMA/CSA101/L.S 2/A440. Exterior side-hinged doors shall be tested and labeled as conforming to AAMA/WDMA/CSA101/L.S 2/A440 or comply with Section 1714A.5.2. Products tested and labeled as conforming to AAMA/WDMA/CSA 101/L.S 2/A440 shall not be subject to the requirements of Sections 2403.2 and 2403.3.

1714A.5.2 Exterior windows and door assemblies not provided for in Section 1714A.5.1. Exterior window and door assemblies shall be tested in accordance with ASTM E330. Exterior window and door assemblies containing glass shall comply with Section 2403. The design pressure for testing shall be calculated in accordance with Chapter 16A. Each assembly shall be tested for 10 seconds at a load equal to 1.5 times the design pressure.

1714A.6 Test specimens. Test specimens and construction shall be representative of the materials, workmanship and details normally used in practice. The properties of the materials used to construct the test assembly shall be determined on the basis of tests on samples taken from the load assembly or on representative samples of the materials used to construct the load test assembly. Required tests shall be conducted or witnessed by an approved agency.

SECTION 1715A
MATERIAL AND TEST STANDARDS

1715A.1 Test standards for joist hangers and connectors.

1715A.1.1 Test standards for joist hangers. The vertical load-bearing capacity, torsional moment capacity and deflection characteristics of joist hangers shall be determined in accordance with ASTM D1761 using lumber having a specific gravity of 0.49 or greater, but not greater than 0.55, as determined in accordance with AF&PA NDS for the joist and headers.

Exception: The joist length shall not be required to exceed 24 inches (610 mm).

1715A.1.2 Vertical load capacity for joist hangers. The vertical load capacity for the joist hanger shall be determined by testing a minimum of three joist hanger assemblies as specified in ASTM D1761. If the ultimate vertical load for any one of the tests varies more than 20 percent from the average ultimate vertical load, at least three additional tests shall be conducted. The allowable vertical load of the joist hanger shall be the lowest value determined from the following:

1. The lowest ultimate vertical load for a single hanger from any test divided by three (where three tests are conducted and each ultimate vertical load does not vary more than 20 percent from the average ultimate vertical load).

2. The average ultimate vertical load for a single hanger from all tests divided by three (where six or more tests are conducted)

3. The average from all tests of the vertical loads that produce a vertical movement of the joist with respect to the header of 0.125 inch (3.2 mm)

4. The sum of the allowable design loads for nails or other fasteners utilized to secure the joist hanger to the wood members and allowable bearing loads that contribute to the capacity of the hanger.

5. The allowable design load for the wood members forming the connection.

1715A.1.3 Torsional moment capacity for joist hangers. The torsional moment capacity for the joist hanger shall be determined by testing at least three joist hanger assemblies as specified in ASTM D1761. The allowable torsional moment of the joist hanger shall be the average torsional moment at which the lateral movement of the top or bottom of the joist with respect to the original position of the joist is 0.125 inch (3.2 mm).

1715A.1.4 Design value modifications for joist hangers. Allowable design values for joist hangers that are determined by Item 4 or 5 in Section 1715A.1 shall be permitted to be modified by the appropriate duration of loading factors as specified in AF&PA NDS but shall not exceed the direct loads as determined by Item 1, 2 or 3 in Section 1715A.1. Allowable design values determined by Item 1, 2 or 3 in Section 1715A.1 shall not be modified by duration of loading factors

1715A.2 Concrete and clay roof tiles.

1715A.2.1 Overturning resistance. Concrete and clay roof tiles shall be tested to determine their resistance to overturning due to wind in accordance with SBC SSTD 11 and Chapter 15.

1715A.2.2 Wind tunnel testing. When roof tiles do not satisfy the limitations in Chapter 16A for rigid tile, a wind tunnel test shall be used to determine the wind characteristics of the concrete or clay tile roof covering in accordance with SBC SSTD 11 and Chapter 15.
1811A.5 Seismic reinforcement. Where a structure is assigned to Seismic Design Category D, E or F in accordance with Section 1613A, the following shall apply. Where concrete and steel are used as part of the pile assembly, the concrete reinforcement shall comply with that given in Sections 1810A 1.2.1 and 1810A 1.2.2 or the steel section shall comply with Section 1810A 6 4.1.

SECTION 1812A
PIER FOUNDATIONS

1812A.1 General. Isolated and multiple piers used as foundations shall conform to the requirements of Sections 1812A 2 through 1812A 10, as well as the applicable provisions of Section 1808A 2.

1812A.2 Lateral dimensions and height. The minimum dimension of isolated piers used as foundations shall be 2 feet (610 mm), and the height shall not exceed 12 times the least horizontal dimension.

1812A.3 Materials. Concrete shall have a 28-day specified compressive strength (f') of not less than 2,500 psi (17.24 MPa). Where concrete is placed through a funnel hopper at the top of the pier, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than 6 inches (152 mm). Where concrete is to be pumped, the mix design including slump shall be adjusted to produce a pumpable concrete.

1812A.4 Reinforcement. Except for steel dowels embedded 5 feet (1524 mm) or less in the pier, reinforcement where required shall be assembled and tied together and shall be placed in the pier hole as a unit before the reinforced portion of the pier is filled with concrete.

Exception: Reinforcement is permitted to be wet set and the 2 1/2-inch (64 mm) concrete cover requirement be reduced to 2 inches (51 mm) for Group R-3 and U occupancies not exceeding two stories of light-frame construction, provided the construction method can be demonstrated to the satisfaction of the building official.

Reinforcement shall conform to the requirements of Sections 1810A 1.2.1 and 1810A 1.2.2.

Exceptions:

1. Isolated piers supporting posts of Group R-3 and U occupancies not exceeding two stories of light-frame construction are permitted to be reinforced as required by rational analysis but not less than a minimum of one No. 4 bar, without ties or spirals, when detailed so the pier is not subject to lateral loads and the soil is determined to be of adequate stiffness.

2. Isolated piers supporting posts and bracing from decks and patios appurtenant to Group R-3 and U occupancies not exceeding two stories of light-frame construction are permitted to be reinforced as required by rational analysis but not less than one No. 4 bar, without ties or spirals, when the lateral load, E, to the top of the pier does not exceed 200 pounds (890 N) and the soil is determined to be of adequate stiffness.

3. Piers supporting the concrete foundation wall of Group R-3 and U occupancies not exceeding two stories of light-frame construction are permitted to be reinforced as required by rational analysis but not less than two No. 4 bars, without ties or spirals, when it can be shown the concrete pier will not rupture when designed for the maximum seismic load, E, and the soil is determined to be of adequate stiffness.

4. Closed ties or spirals where required by Section 1810A 1.2.2 are permitted to be limited to the top 3 feet (914 mm) of the piers 10 feet (3048 mm) or less in depth supporting Group R-3 and U occupancies of Seismic Design Category D, not exceeding two stories of light-frame construction.

1812A.5 Concrete placement. Concrete shall be placed in such a manner as to ensure the exclusion of any foreign material and to secure a full-sized shaft. Concrete shall not be placed through water except where a tremie or other approved method is used. When depositing concrete from the top of the pier, the concrete shall not be chuted directly into the pier but shall be poured in a rapid and continuous operation through a funnel hopper centered at the top of the pier.

1812A.6 Belled bottoms. Where pier foundations are belled at the bottom, the edge thickness of the bell shall not be less than that required for the edge of footings. Where the sides of the bell slope at an angle less than 60 degrees (1 rad) from the horizontal, the effects of vertical shear shall be considered.

1812A.7 Masonry. Where the unsupported height of foundation piers exceeds six times the least dimension, the allowable working stress on piers of unit masonry shall be reduced in accordance with ACI 530/ASCE 5/TMS 402.

1812A.8 Concrete. Piers shall be constructed of reinforced concrete, and shall conform to the requirements for columns in ACI 318.

1812A.9 Steel shell. Where concrete piers are entirely encased with a circular steel shell, and the area of the shell steel is considered reinforcing steel, the steel shall be protected under the conditions specified in Section 1808A 2.17. Horizontal joints in the shell shall be spliced to comply with Section 1808A 2.7.

1812A.10 Dewatering. Where piers are carried to depths below water level, the piers shall be constructed by a method that will provide accurate preparation and inspection of the bottom, and the depositing of construction of sound concrete or other masonry in the dry.
2205A.4.1.5.1 AISC 341, Part I, Section 13, Members. Add a new section as follows:

AISC 341, 13.2f—Member Types

The use of rectangular HSS are not permitted for bracing members, unless filled solid with cement grout having a minimum compressive strength of 3000 psi (20.7 MPa) at 28 days. The effects of composite action in the filled composite brace shall be considered in the sectional properties of the system where it results in the more severe loading condition or detailing.

2205A.4.1.6 Part I, Section 14, Ordinary Concentrically Braced Frames (OCBF). Not permitted by OSHPD

2205A.4.1.7 Part I, Section 15, Eccentrically Braced Frames (EBF) Modifications.

Part I, 15.4 Link-to-Column Connections.

Exception: Not permitted by OSHPD

2205A.4.2 Appendix S, Qualifying Cyclic Tests of Beam-to-Column and Link-to-Column Connections Modifications.

2205A.4.2.1 Appendix S, S3, Definitions. Replace the definition of “Inelastic rotation” with the following:

INELASTIC ROTATION. The permanent or plastic portion of the rotation angle between a beam and the column, or between a link and the column of the test specimen, measured in radians. The inelastic rotation shall be computed based upon an analysis of the test specimen deformations. Sources of inelastic rotation include yielding of members and connectors, yielding of connection elements and slip between members and connection elements. For beam-to-column moment connections in special moment frames, the inelastic rotation is represented by the plastic chord rotation angle calculated as the plastic deflection of the beam or girder, at the center of its span divided by the distance between the center of the beam span and the centerline of the panel zone of the beam-column connection. For link-to-column connections in eccentrically braced frames, inelastic rotation shall be computed based upon the assumption that inelastic action is concentrated at a single point located at the intersection of the centerline of the link with the face of the column.

2205A.4.2.2 Appendix S, S3, Definitions. Add the following:

RAPID STRENGTH DETERIORATION: A mode of behavior characterized by a sudden loss of strength in a cyclic test with constant or increasing deformation amplitude, a loss of strength of more than 50 percent of the strength attained in the previous excursion in the same loading direction.

2205A.4.2.3 Appendix S, Section S5.2, Size of Members. Replace as follows:

The size of the beam or link used in the test specimen shall be within the following limits.

1. At least one of the test beams or links shall be no less than 100 percent of the depth of the prototype beam or link. For the remaining specimens, the depth of the test beam or link shall be no less than 90 percent of the depth of the prototype beam or link.

2. At least one of the test beams or links shall be no less than 100 percent of the weight per foot of the prototype beam or link. For the remaining specimens, the weight per foot of the test beam or link shall be no less than 75 percent of the weight per foot of the prototype beam or link.

The size of the column used in the test specimen shall properly represent the inelastic action in the column, as per the requirements in Section S5.1. In addition, the depth of the test column shall be no less than 90 percent of the depth of the prototype column.

Extrapolation beyond the limitations stated in this section shall be permitted subject to peer review and approval by the enforcement agency.

2205A.4.2.4 Appendix S, Section S10, Acceptance Criteria. Replace as follows:

The test specimens must satisfy the strength, interstory drift angle, or link rotation angle, and inelastic rotation requirements of these provisions for the special moment frame and eccentrically braced frame connection as applicable. The test specimen must sustain the required interstory drift angle, or link rotation angle, and inelastic rotation for at least two complete loading cycles without exhibiting rapid strength deterioration.

2205A.4.3 Appendix T, Qualifying Cyclic Tests of Buckling-Restrained Braces Modification.

AISC 341, T5.3, Similarity of Brace Test Specimen and Prototype, replace Item 2 with the following:

The axial yield strength of the steel core $P_{yx}$ of the brace test specimen shall not be more than 20 percent above or 50 percent less than that of the test specimen where both strengths are based on the core area, $A_{yx}$, multiplied by the yield strength as determined from a coupon test. In addition, the material of the test specimen shall be the same ASTM classification and grade as the prototype.

2205A.5 Modifications to AISC 358 [OSHPD 1 & 4]

2205A.5.1.2 Design Requirements, 2.1 Special and Intermediate Moment Frame Connection Types, Table 2-1 Prequalified Moment Connections modifications.

The prequalification of bolted unstiffened extended end plate and bolted stiffened extended end plate connections in buildings is not permitted by OSHPD.

The prequalification of moment connections at orthogonal moment frames sharing common columns or moment
connections attached to other than one side or two opposite sides of a column is not permitted by OSHPD.

2205A.2 Reduced beam section (RBS) moment connection modifications.

AISC 358, 5.3.1.7—Lateral bracing of beam shall be provided as follows: Replace the exception with the following.

Exception: For both systems, where the beam supports a concrete structural slab that is connected between the protected zones with welded shear connectors spaced a maximum of 12 inches (300 mm) on center; supplemental top and bottom flange bracing at the reduced section may be omitted, subject to the approval of the enforcement agency. The concrete structural slab for the purposes of lateral bracing of the beam shall have a minimum of 5/16 inches (133 mm) in total thickness including metal deck, where occurs, have a minimum compressive strength of 4000 psi (27.2 MPa) at 28 days and contain 6x4 W4xW4 WWF or equal.

SECTION 2206A
STEEL JOISTS

2206A.1 General. The design, manufacture and use of open web steel joists and joist girders shall be in accordance with one of the following Steel Joist Institute (SJI) specifications:

1. SJI K-1.1
2. SJI LH/DL H-1.1
3. SJI IG-1.1

Where required, the seismic design of buildings shall be in accordance with the additional provisions of Section 2205A 2 or 2210A 5.

2206A.2 Design. The registered design professional shall indicate on the construction documents the steel joist and/or steel joist girders designations from the specifications listed in Section 2206A 1 and shall indicate the requirements for joist and joist girder design, layout, end supports, anchorage, non-SJI standard bridging, bridging termination connections and bearing connection design to resist uplift and lateral loads. These documents shall indicate special requirements as follows:

1. Special loads including:
   1.1 Concentrated loads;
   1.2 Nonuniform loads;
   1.3 Net uplift loads;
   1.4 Axial loads;
   1.5 End moments; and
   1.6 Connection forces

2. Special considerations including:
   2.1 Profiles for nonstandard joist and joist girder configurations (standard joist and joist girder configurations are as indicated in the SJI catalog);
   2.2 Oversized or other nonstandard web openings; and
   2.3 Extended ends

3. Deflection criteria for live and total loads for non-SJI standard joists.

2206A.3 Calculations. The steel joist and joist girder manufacturer shall design the steel joists and/or steel joist girders in accordance with the current SJI specifications and load tables to support the load requirements of Section 2206A 2. The registered design professional may require submission of the steel joist and joist girder calculations as prepared by a registered design professional responsible for the product design. If requested by the registered design professional, the steel joist manufacturer shall submit design calculations with a cover letter bearing the seal and signature of the joist manufacturer's registered design professional. In addition to standard calculations under this seal and signature, submittal of the following shall be included:

1. Non-SJI standard bridging details (e.g. for cantilevered conditions, net uplift, etc.).
2. Connection details for:
   2.1 Non-SJI standard connections (e.g. flush-framed or framed connections);
   2.2 Field splices; and
   2.3 Joist headers

2206A.4 Steel joist drawings. Steel joist placement plans shall be provided to show the steel joist products as specified on the construction documents and are to be utilized for field installation in accordance with specific project requirements as stated in Section 2206A.2 Steel placement plans shall include, at a minimum, the following:

1. Listing of all applicable loads as stated in Section 2206A.2 and used in the design of the steel joists and joist girders as specified in the construction documents.
2. Profiles for nonstandard joist and joist girder configurations (standard joist and joist girder configurations are as indicated in the SJI catalog).
3. Connection requirements for:
   3.1 Joist supports;
   3.2 Joist girder supports;
   3.3 Field splices; and
   3.4 Bridging attachments.
4. Deflection criteria for live and total loads for non-SJI standard joists.
5. Size, location and connections for all bridging.

Design approval. Joist and joist girder design calculations and profiles with member sizes and connection details, and joist placement plans shall be provided to the enforcement agency and approved prior to joist fabrication, in accordance with Title 24, Part 1. Joist and joist girder design calculations and profiles with member sizes and connection details shall bear the signature and stamp or seal of the registered engineer or licensed architect responsible for the joist design. Alterations to the approved joist and joist girder design calculations and profiles with member sizes and connection details, or to fabricated joists are subject to the approval of the enforcement agency.
5. The alterations do not create a structural irregularity as defined in ASCE 7 or make an existing structural irregularity more severe.

6. The alterations do not result in the creation of an unsafe condition.

3403.2.3.3 Adoption [OSHPD 2] All additions, alterations, repairs and seismic retrofit to the existing structures or portions thereof may be designed and constructed in accordance with the provisions of FEMA 356, as modified herein.

3403.2.3.3.1 Referenced standards. All referenced standards listed in FEMA 356 shall be replaced by referenced standards listed in Chapter 35 of this code.

3403.2.3.3.2 FEMA 356 Section 1.5—Target building performances. Target building performance level shall be Life Safety Building Performance Level (3-C) as defined in Section 1.5.3.3, with Structural performance level S-3 as defined in Section 1.5.1.3 and Non-structural performance level N-C as defined in Section 1.5.2.3.

3403.2.3.3.3 FEMA 356 Section 1.6—Seismic hazard. The ground motion characterization shall be based on ground shaking having a 10-percent probability of exceedance in 50 years.

Ground shaking having a 10-percent probability of exceedance in 50 years need not exceed 1/2 of the maximum considered earthquake.

Response spectra and acceleration time histories shall be constructed in accordance with Sections 1613, 1802.7 and 1802.8.

3403.2.3.3.4 Analysis procedure. The selection of a particular analysis procedure from FEMA 356 may be subject to the approval of the enforcement agent.

3403.2.3.3.5 Design criteria. Prior to implementation of FEMA 356 non-linear procedures, the ground motion, analysis and design methods, material assumptions and acceptance criteria proposed by the engineer shall be reviewed by the enforcement agent.

3403.2.3.3.6 Enforcement agency approval. The analysis, conclusion and design decisions shall be reviewed and accepted by the enforcement agent.

3403.2.3.3.7 Structural observation, testing and inspections. Construction observation, inspection and structural observation requirements shall be as required for new construction.

3403.3 Nonstructural. Nonstructural alterations or repairs to an existing building or structure are permitted to be made of the same materials of which the building or structure is constructed, provided that they do not adversely affect any structural member or the fire-resistance rating of any part of the building or structure.

3403.4 Stairways. An alteration or the replacement of an existing stairway in an existing structure shall not be required to comply with the requirements of a new stairway as outlined in Section 1009 where the existing space and construction will not allow a reduction in pitch or slope.

3404 FIRE ESCAPES

3404.1 Where permitted. Fire escapes shall be permitted only as provided for in Sections 3404.1.1 through 3404.1.4.

3404.1.1 New buildings. Fire escapes shall not constitute any part of the required means of egress in new buildings.

3404.1.2 Existing fire escapes. Existing fire escapes shall be continued to be accepted as a component in the means of egress in existing buildings only.

3404.1.3 New fire escapes. New fire escapes for existing buildings shall be permitted only where exterior stairs cannot be utilized due to lot lines limiting stair size or due to the sidewalks, alleys or roads at grade level. New fire escapes shall not incorporate ladders or access by windows.

3404.1.4 Limitations. Fire escapes shall comply with this section and shall not constitute more than 50 percent of the required number of exits nor more than 50 percent of the required exit capacity.

3404.2 Location. Where located on the front of the building and where projecting beyond the building line, the lowest landing shall not be less than 7 feet (2134 mm) or more than 12 feet (3658 mm) above grade, and shall be equipped with a counter-balanced stairway to the street. In alleyways and thoroughfares less than 30 feet (9144 mm) wide, the clearance under the lowest landing shall not be less than 12 feet (3658 mm).

3404.3 Construction. The fire escape shall be designed to support a live load of 100 pounds per square foot (4788 Pa) and shall be constructed of steel or other approved noncombustible materials. Fire escapes constructed of wood not less than nominal 2 inches (51 mm) thick are permitted on buildings of Type 5 construction. Walkways and railings located over or supported by combustible roofs in buildings of Type 3 and 4 construction are permitted to be of wood not less than nominal 2 inches (51 mm) thick.

3404.4 Dimensions. Stairs shall be at least 22 inches (559 mm) wide with risers not more than, and treads not less than, 8 inches (203 mm) and landings at the foot of stairs not less than 40 inches (1016 mm) wide by 36 inches (914 mm) long, located not more than 8 inches (203 mm) below the door.

3404.5 Opening protective. Doors and windows along the fire escape shall be protected with 1/2-hour opening protective.
SECTION 3406
CHANGE OF OCCUPANCY

3406.1 Conformance. No change shall be made in the use or occupancy of any building that would place the building in a different division of the same group of occupancy or in a different group of occupancies, unless such building is made to comply with the requirements of this code for such division or group of occupancy. Subject to the approval of the building official, the use or occupancy of existing buildings shall be permitted to be changed and the building is allowed to be occupied for purposes in other groups without conforming to all the requirements of this code for those groups, provided the new or proposed use is less hazardous, based on life and fire risk, than the existing use.

3406.2 Certificate of occupancy. A certificate of occupancy shall be issued where it has been determined that the requirements for the new occupancy classification have been met.

3406.3 Stairways. Existing stairways in an existing structure shall not be required to comply with the requirements of a new stairway as outlined in Section 1009 where the existing space and construction will not allow a reduction in pitch or slope.

3406.4 Change of occupancy. When a change of occupancy results in a structure being reclassified to a higher occupancy category, the structure shall conform to the seismic requirements for a new structure.

Exceptions:

1. Specific seismic detailing requirements of this code or ASCE 7 for a new structure shall not be required to be met where it can be shown that the level of performance and seismic safety is equivalent to that of a new structure. Such analysis shall consider the regularity, overstrength, redundancy, and ductility of the structure within the context of the existing and retrofit (if any) detailing provided.

2. When a change of use results in a structure being reclassified from Occupancy Category I or II to Occupancy Category III and the structure is located in a seismic map area where $S_{30} < 0.33$, compliance with the seismic requirements of this code and ASCE 7 are not required.

SECTION 3407
HISTORICAL BUILDINGS

[DSA-AC] For applications listed in Section 109.1 regulated by the Division of the State Architect—Access Compliance for Qualified Historical Buildings, see California Code of Regulations, Title 24, Part 8 (California Historical Building Code).

3407.1 Historic buildings. The provisions of this code relating to the construction, repair, alteration, addition, restoration and movement of structures, and change of occupancy shall not be mandatory for historic building official to not constitute a distinct life safety hazard.

3407.2 Flood hazard areas. Within flood hazard areas established in accordance with Section 1612.3, where the work proposed constitutes substantial improvement as defined in Section 1612.2, the building shall be brought into conformance with Section 1612.

Exception: Historic buildings that are:

1. Listed or preliminarily determined to be eligible for listing in the National Register of Historic Places; or
2. Determined by the Secretary of the U.S. Department of Interior as contributing to the historical significance of a registered historic district or a district preliminary determined to qualify as a historic district; or
3. Designated as historic under a state or local historic preservation program that is approved by the Department of Interior.

SECTION 3408
MOVED STRUCTURES

3408.1 Conformance. Structures moved into or within the jurisdiction shall comply with the provisions of this code for new structures.

Exception: [HCD] After July 1, 1978, local ordinances or regulations for moved apartment houses and dwellings shall permit the retention of existing materials and methods of construction, provided the apartment house or dwelling complies with the building standards for foundations applicable to new construction and does not become or continue to be a substandard building. For additional information, see Health and Safety Code Section 17958.9.

SECTION 3409
Reserved

SECTION 3410
COMPLIANCE ALTERNATIVES

3410.1 Compliance. The provisions of this section are intended to maintain or increase the current degree of public safety, health and general welfare in existing buildings while permitting repair, alteration, addition and change of occupancy without requiring full compliance with Chapters 2 through 33, or Sections 3401.3, and 3403 through 3407, except where compliance with other provisions of this code is specifically required in this section.

3410.2 Applicability. Structures existing prior to January 1, 2008, in which there is work involving additions, alterations or changes of occupancy shall be made to conform to the requirements of this section or the provisions of Sections 3403 through 3407. The provisions in Sections 3410.2.1 through 3410.2.5 shall apply to existing occupancies that will continue to be, or are proposed to be, in Groups A, B, E, F, M, R, S and U. These provisions shall not apply to buildings with occupancies in Group H or I.

3410.2.1 Change in occupancy. Where an existing building is changed to a new occupancy classification and this section is applicable, the provisions of this section for the
CHAPTER 34A
EXISTING STRUCTURES

SECTION 3401A
GENERAL

3401A.1 Scope. The provisions of this chapter shall control the alteration, repair, addition and change of occupancy of existing structures for applications listed in Sections 110.1 (OSHPD 1), and 110.4 (OSHPD 4) regulated by the Office of Statewide Health Planning and Development (OSHPD).

These applications include hospitals, skilled nursing facilities, intermediate care facilities and correctional treatment centers.

Exception: [OSHPD 2] Single-story Type V skilled nursing or intermediate care facilities utilizing wood-frame or light-steel-frame construction as defined in Health and Safety Code Section 129725, which shall comply with Chapter 34 and any applicable amendments therein.

[DSA-AC] For applications listed in Section 109.1 regulated by the Division of State Architect—Access Compliance for accessibility requirements, see Chapter 11B, Section 1134B

3401A.2 Maintenance. Buildings and structures, and parts thereof, shall be maintained in a safe and sanitary condition. Devices or safeguards which are required by this code shall be maintained in conformance with the code edition under which installed. The owner or the owner’s designated agent shall be responsible for the maintenance of buildings and structures. To determine compliance with this subsection, the building official shall have the authority to require a building or structure to be re-inspected. The requirements of this chapter shall not provide the basis for removal or abrogation of fire protection and safety systems and devices in existing structures.

3401A.3 Compliance with other codes. Alterations, repairs, additions and changes of occupancy to existing structures shall comply with the provisions for alterations, repairs, additions and changes of occupancy in the California Fire Code, California Mechanical Code, California Plumbing Code, and California Electrical Code.

SECTION 3402A
DEFINITIONS

3402A.1 Definitions. The following terms shall, for the purposes of this chapter and as used elsewhere in the code, have the following meaning. Definitions provided in Section 1613A 2, ASCE 7 Section 11 2 and Chapter 6 of Title 24, Part 1, Building Standards Administrative Code, shall apply when appropriate in addition to terms defined in this section.

APPROVED EXISTING BUILDING means any building originally constructed in compliance with the requirements of 1973 or subsequent edition of California Building Code.

ASSOCIATED STRUCTURAL ALTERATIONS means any change affecting existing structural elements or requiring new structural elements for vertical or lateral support of an otherwise nonstructural alteration.

DESIGN is the procedure that includes both the evaluation and retrofit design of an existing element and design of new element.

DESIGN EARTHQUAKE is the earthquake ground motion defined in Section 3413A 2.2.

ESSENTIAL LIFE SAFETY is the retrofit or repair of a structure to a goal of essential life safety as a level of expected structural performance taken to mean that occupants will be able to exit the structure safely following an earthquake. It does not mean that they will be uninjured or not be in need of medical attention. A structure is presumed to achieve this level of performance where, although significant damage to the structure may have occurred, some margin against either total or partial structural collapse remains, even though damage may not be economical to repair. Major structural elements have not become dislodged or fallen so as to pose a life safety threat, and, nonstructural systems or elements, which are heavy enough to cause severe injuries either within or outside the building, have not become dislodged so as to pose a life safety threat. This level of structural performance is equivalent to SPC 2.

IMMEDIATE OCCUPANCY. The retrofit or repair of a structure to a goal of immediate occupancy as a level of expected performance is taken to mean the post-earthquake damage state in which limited structural and nonstructural damage has occurred. The original strength and stiffness of the structure is substantially retained, with minor cracking and yielding of structural elements. Basic access and life safety systems, including doors, stairways, elevators, emergency lighting, fire alarms and suppression systems, remain operable, provided that utilities are available. It is expected that occupants could safely remain in the building, although normal use may be impaired and some clean-up, inspection and limited structural and nonstructural repairs may be required. This level of expected structural performance is equivalent to SPC 3 through SPC 5.

INCIDENTAL STRUCTURAL ALTERATIONS OR ADDITIONS are alterations or additions which would not reduce the story lateral shear force-resisting capacity by more than 5 percent or increase the story shear by more than 5 percent in any existing story.

MAJOR STRUCTURAL ALTERATIONS OR ADDITIONS are those alterations or additions of greater extent than minor structural alterations or additions.

MINOR STRUCTURAL ALTERATIONS OR ADDITIONS are alterations or additions of greater extent than incidental structural additions or alterations which would not reduce the story shear lateral-force-resisting capacity by more than 10 percent or increase base shear by more than 10 percent.
NONREQUIRED STRUCTURAL ALTERATION is any alteration of existing structural element or provision of new structural elements which is not necessary for vertical or lateral support of other work and is initiated by the applicant primarily for the purpose of increasing the vertical or lateral load-carrying strength or stiffness of an existing building.

NONSTRUCTURAL ALTERATION is any alteration which neither affects existing structural elements nor requires new structural elements for vertical or lateral support and which does not increase the lateral shear force in any story by more than 5 percent.

NONSTRUCTURAL PERFORMANCE CATEGORY (NPC) are the building performance categories for hospital buildings defined in Table 11.1 of California Building Standards Administrative Code (Part I, Title 24 CCR), Chapter 6.

PEER REVIEW refers to procedure contained in Section 3414A.

PRIMARY FUNCTION. A primary function is a major activity for which the facility is intended. Areas that contain a primary function include, but are not limited to, the customer service lobby of a bank, the dining area of a cafeteria, the meeting rooms in a conference center, as well as offices and other work areas in which the activities of the public accommodation or other private entity using the facility are carried out. Mechanical rooms, boiler rooms, supply storage rooms, employee lounges or locker rooms, janitorial closets, entrances, corridors and restrooms are not areas containing a primary function.

RECONSTRUCTION means rebuilding of any existing building to bring it into full compliance with these regulations.

REPAIR, as used in this division, means all the design and construction work affecting existing or requiring new structural elements undertaken to restore or enhance the structural and nonstructural load-resisting system participating in lateral response of a structure primarily intended to correct the effects of deterioration or impending or actual failure, regardless of cause.

STRUCTURAL PERFORMANCE CATEGORY (SPC) are the building performance categories for hospital buildings defined in Table 2.5.3 of California Building Standards Administrative Code (Part I, Title 24 CCR), Chapter 6.

TECHNICALLY INFEASIBLE. An alteration of a building or a facility that has little likelihood of being accomplished because the existing structural conditions require the removal or alteration of a load-bearing member that is an essential part of the structural frame, or because other existing physical or site constraints prohibit modification or addition of elements, spaces or features which are in full and strict compliance with the minimum requirements for new construction and which are necessary to provide accessibility.

SECTION 3403A
ADDITIONS, ALTERATIONS OR REPAIRS

3403A.1 Existing buildings or structures. Additions or alterations to any building or structure shall comply with the requirements of the code for new construction. Additions or alterations shall not be made to an existing building or structure that will cause the existing building or structure to be in violation of any provisions of this code. An existing building plus additions shall comply with the height and area provisions of Chapter 5. Portions of the structure not altered and not affected by the alteration are not required to comply with the code requirements for a new structure.

3403A.1.1 Flood hazard areas. For buildings and structures in flood hazard areas established in Section 1612A.3, any additions, alterations or repairs that constitute substantial improvement of the existing structure, as defined in Section 1612A.2, shall comply with the flood design requirements for new construction, and all aspects of the existing structure shall be brought into compliance with the requirements for new construction for flood design.

3403A.2 Structural. Additions or alterations to an existing structure shall not increase the force in any structural element by more than 5 percent, unless the increased forces on the element are still in compliance with the code for new structures, and shall not eliminate the strength of any structural element by less than that required by this code for new structures. Where repairs are made to structural elements of an existing building, and uncovered structural elements are found to be unsound or otherwise structurally deficient, such elements shall be made to conform to the requirements for new structures.

3403A.2.1 Existing live load. Where an existing structure heretofore is altered or repaired, the minimum design loads for the structure shall be the loads applicable at the time of erection, provided that public safety is not endangered thereby.

3403A.2.2 Live load reduction. If the approved live load is less than required by Section 1607A, the areas designed for the reduced live load shall be posted in with the approved load. Placards shall be of an approved design.

3403A.2.3 Seismic. Additions, alterations or modification or change of occupancy of existing buildings shall be in accordance with this section for the purposes of seismic considerations.

3403A.2.3.1 Additions to existing buildings. An addition that is structurally independent from an existing structure shall be designed and constructed with the seismic requirements for new structures. An addition that is not structurally independent from an existing structure shall be designed and constructed such that the entire structure conforms to the seismic-force-resistance requirements for new structures unless the following conditions are satisfied:

1. The addition conforms with the requirements for new structures.
2. The addition does not increase the seismic forces in any structural element of the existing structure by more than 5 percent cumulative since the original construction, unless the element has the capacity to resist the increased forces determined in accordance with ASCE 7, and
3. Additions do not decrease the seismic resistance of any structural element of the existing structure by
more than 5 percent cumulative since the original construction, unless the element has the capacity to resist the forces determined in accordance with ASCE 7. If the building’s seismic base shear capacity has been increased since the original construction, the percent change in base shear may be calculated relative to the increased value.

3403A.2.3.2 Alterations. Alterations are permitted to be made to any structure without requiring the structure to comply with Section 1613A, provided the alterations conform to the requirements for a new structure. Alterations that increase the seismic force in any existing structural element by more than 5 percent cumulative since the original construction or decrease the design strength of any existing structural element to resist seismic forces by more than 5 percent cumulative since the original construction shall not be permitted unless the entire seismic-force-resisting system is determined to conform to ASCE 7 for a new structure. If the building’s seismic base shear capacity has been increased since the original construction, the percent change in base shear may be calculated relative to the increased value.

Exception: Alterations to existing structural elements or additions of new structural elements that are not required by ASCE 7 and are initiated for the purpose of increasing the strength or stiffness of the seismic-force-resisting system of an existing structure need not be designed for forces conforming to ASCE 7, provided that an engineering analysis is submitted indicating the following:

1. The design strength of existing structural elements required to resist seismic forces is not reduced.
2. The seismic force to required existing structural elements is not increased beyond their design strength.
3. New structural elements are detailed and connected to the existing structural elements as required by Chapter 16A.
4. New or relocated nonstructural elements are detailed and connected to existing or new structural elements as required by Chapter 16A.
5. The alterations do not create a structural irregularity as defined in ASCE 7 or make an existing structural irregularity more severe.
6. The alterations do not result in the creation of an unsafe condition.

3403A.2.3.3 Adoption. Except for the modifications as set forth in Sections 3411A through 3414A, all additions, alterations, repairs and seismic retrofit to existing structures or portions thereof may be designed and constructed in accordance with the provisions of FEMA 356.

3403A.2.3.3.1 Referenced standards. All referenced standards listed in FEMA 356 shall be replaced by referenced standards listed in Chapter 35 of this code.

3403A.2.3.3.2 Material testing required. Use of material properties based on historical information as default values shall not be permitted.

3403A.2.3.3.3 Analysis procedure. The selection of a particular analysis procedure from FEMA 356 shall be subject to the approval of the enforcement agent.

3403A.2.3.3.4 Design criteria. Prior to implementation of FEMA 356 nonlinear procedures, the ground motion, analysis, and design methods, material assumptions, and acceptance criteria proposed by the engineer shall be peer reviewed and/or reviewed by the enforcement agent.

3403A.2.3.3.5 Enforcement agency approval. The analysis, conclusion, and design decisions shall be reviewed and accepted by the peer reviewer(s) and/or enforcement agent.

3403A.2.3.3.6 Structural observation, testing and inspections. Construction testing, inspection and structural observation requirements shall be as required for new construction.

3403A.3 Nonstructural. Nonstructural alterations or repairs to an existing building or structure are permitted to be made of the same materials of which the building or structure is constructed, provided that they do not adversely affect any structural member or the fire-resistance rating of any part of the building or structure.

3403A.4 Stairways. An alteration or the replacement of an existing stairway in an existing structure shall not be required to comply with the requirements of a new stairway as outlined in Section 1099 where the existing space and construction will not allow a reduction in pitch or slope.

SECTION 3404A FIRE ESCAPES

3404A.1 Where permitted. Fire escapes shall be permitted only as provided for in Sections 3404A.1 through 3404A.1.4.

3404A.1.1 New buildings. Fire escapes shall not constitute any part of the required means of egress in new buildings.

3404A.1.2 Existing fire escapes. Existing fire escapes shall be continued to be accepted as a component in the means of egress in existing buildings only.

3404A.1.3 New fire escapes. New fire escapes for existing buildings shall be permitted only where exterior stairs cannot be utilized due to lot lines limiting stair size or due to the sidewalks, alleys or roads at grade level. New fire escapes shall not incorporate ladders or access by windows.

3404A.1.4 Limitations. Fire escapes shall comply with this section and shall not constitute more than 50 percent of the required number of exits or more than 50 percent of the required exit capacity.

3404A.2 Location. Where located on the front of the building and where projecting beyond the building line, the lowest landing shall not be less than 7 feet (2134 mm) or more than 12 feet (3658 mm) above grade, and shall be equipped with a counterbalanced stairway to the street. In alleyways and thoroughfares
less than 30 feet (9144 mm) wide, the clearance under the lowest landing shall not be less than 12 feet (3658 mm)

3404A.3 Construction. The fire escape shall be designed to support a live load of 100 pounds per square foot (4788 Pa) and shall be constructed of steel or other approved noncombustible materials. Fire escapes constructed of wood not less than nominal 2 inches (51 mm) thick are permitted on buildings of Type 5 construction. Walkways and railings located over or supported by combustible roofs in buildings of Type 3 and 4 construction are permitted to be of wood not less than nominal 2 inches (51 mm) thick.

3404A.4 Dimensions. Stairs shall be at least 22 inches (559 mm) wide with risers not more than, and treads not less than, 8 inches (203 mm) and landings at the foot of stairs not less than 40 inches (1016 mm) wide by 36 inches (914 mm) long, located not more than 8 inches (203 mm) below the door.

3404A.5 Opening protective. Doors and windows along the fire escape shall be protected with 1/4-hour opening protective

SECTION 3405A
GLASS REPLACEMENT

3405A.1 Conformance. The installation or replacement of glass shall be as required for new installations.

SECTION 3406A
CHANGE OF OCCUPANCY

3406A.1 Conformance. No change shall be made in the use or occupancy of any building that would place the building in a different division of the same group of occupancy or in a different group of occupancies, unless such building is made to comply with the requirements of this code for such division or group of occupancy. Subject to the approval of the building official, the use or occupancy of existing buildings shall be permitted to be changed and the building is allowed to be occupied for purposes in other groups without conforming to all the requirements of this code for those groups, provided the new or proposed use is less hazardous, based on life and fire risk, than the existing use.

3406A.2 Certificate of occupancy. A certificate of occupancy shall be issued where it has been determined that the requirements for the new occupancy classification have been met.

3406A.3 Stairways. Existing stairways in an existing structure shall not be required to comply with the requirements of a new stairway as outlined in Section 1009 where the existing space and construction will not allow a reduction in pitch or slope.

3406A.4 Change of occupancy. When a change of occupancy results in a structure being reclassified to a higher occupancy category, the structure shall conform to the seismic requirements for a new structure.

Exception: Specific seismic detailing requirements of this code or ASCE 7 for a new structure shall not be required to be met where it can be shown that the level of performance and seismic safety is equivalent to that of a new structure. Such analysis shall consider the regularity, overstrength, redundancy and ductility of the structure within the context of the existing and retrofit (if any) detailing provided.

SECTION 3407A
HISTORIC BUILDINGS

3407A.1 Historic buildings. See Title 24, Part 8. The provisions of this code relating to the construction, repair, alteration, addition, restoration and movement of structures, and change of occupancy shall not be mandatory for historic buildings where such buildings are judged by the building official to not constitute a distinct life safety hazard.

3407A.2 Flood hazard areas. Within flood hazard areas established in accordance with Section 1612A.3, where the work proposed constitutes substantial improvement as defined in Section 1612A.2, the building shall be brought into conformity with Section 1612A.

Exception: Historic buildings that are:

1. Listed or preliminarily determined to be eligible for listing in the National Register of Historic Places; or
2. Determined by the Secretary of the U.S. Department of Interior as contributing to the historical significance of a registered historic district or a district preliminarily determined to qualify as an historic district; or
3. Designated as historic under a state or local historic preservation program that is approved by the Department of Interior.

SECTION 3408A
MOVED STRUCTURES

3408A.1 Conformance. Structures moved into or within the jurisdiction shall comply with the provisions of this code for new structures.

SECTION 3409A
Reserved

[EB] SECTION 3410A
COMPLIANCE ALTERNATIVES

3410A.1 Compliance. The provisions of this section are intended to maintain or increase the current degree of public safety, health and general welfare in existing buildings while permitting repair, alteration, addition and change of occupancy without requiring full compliance with Chapter 2 through 33, or Section 3401A.3, and 3403A through 3407A, except where compliance with other provisions of this code is specifically required in this section.

3410A.2 Applicability. Structures existing prior to January 1, 2008 in which there is work involving additions, alterations or changes of occupancy shall be made to conform to the requirements of this section or the provisions of Section 3403A through 3407A. The provisions in Sections 3410A.2.1 through 3410A.2.5 shall apply to existing occupancies that will continue to be, or are proposed to be, in Groups A, B, E, F, M, R, S.

*a MFS = Mandatory Fire Safety; MME = Mandatory Means of Egress; MGS = Mandatory General Safety*

### 3410A.9 Evaluation of building safety
The mandatory safety score in Table 3410A.8 shall be subtracted from the building score in Table 3410A.7 for each category. Where the final score for any category equals zero or more, the building is in compliance with the requirements of this section. Where the final score for any category is less than zero, the building is not in compliance with the requirements of this section.

#### 3410A.9.1 Mixed occupancies
For mixed occupancies, the following provisions shall apply:

1. Where the separation between mixed occupancies does not qualify for any category indicated in Section 3410A 6.16, the mandatory safety scores for the occupancy with the lowest general safety score in Table 3410A 8 shall be utilized (see Section 3410A.6).

2. Where the separation between mixed occupancies qualifies for any category indicated in Section 3410A 6.16, the mandatory safety scores for each occupancy shall be placed against the evaluation scores for the appropriate occupancy.

### SECTION 3411A
ADDITIONS, ALTERATIONS, REPAIRS AND SEISMIC RETROFIT TO EXISTING BUILDINGS OR STRUCTURES

Existing hospital buildings (as defined in Section 7-111 Part 1, Title 24, Building Standards Administrative Code)

**Note:** Alterations to lateral shear force-resisting capacity and story lateral shear forces shall be considered to be cumulative for purposes of defining incidental or minor alterations or additions. The percentage of cumulative changes shall be based on as-built conditions existing on March 7, 1973 or since the original construction if built after March 7, 1973.

#### 3411A.1 Alterations
For this section, alterations include any additions, alterations, repairs and/or seismic retrofit to a hospital building or portions thereof. The provision of Section 3403A shall apply for hospital buildings.

#### 3411A.2 Seismic retrofit
Any seismic retrofit of hospital buildings required by Article 2 and Article 11, Chapter 6, Part 1, Title 24, shall meet the requirements of Sections 3403A, 3412A through 3414A.

**Exception:** Hospital buildings evaluated to SPC 1 due to deficiencies identified by Article 10, Chapter 6, Part 1, Title 24, may be upgraded to SPC 2 by altering, repairing or seismically retrofitting these conditions in accordance with the requirements of Sections 3403A, 3412A through 3414A.

#### 3411A.3 Alterations, additions and repairs to existing buildings or structures not required by Chapter 6, Part 1, Title 24.

#### 3411A.3.1 Approved existing buildings
Structural alterations or repairs may be made to an approved building, provided the entire building, as modified, including structural alterations or repairs, conforms to Sections 3403A, 3412A through 3414A requirements for the seismic structural performance category (SPC) of the building as determined by Chapter 6, Part 1, Title 24. Additions shall conform to the requirements of these regulations for new construction.

#### 3411A.3.2 Pre-1973 buildings

##### 3411A.3.2.1 Incidental structural alterations, additions or repairs
The existing structural elements affected by the alteration, addition or repair shall conform or shall be made to conform to the vertical load requirements of these regulations. Incidental structural additions will be permitted, provided the additions meet these regulations for new construction using importance.

factor, 1, equal to or greater than 1.0. Alterations or
repairs to the existing lateral-load-resisting system must
meet the requirements of Sections 3403A, 3412A through
3414A

3411A.3.2.2 Minor structural alteration, additions or
repairs. Minor structural alterations, additions or
repairs shall be permitted, provided they meet the follow-
ing: Alterations to existing gravity and/or lateral-
load-resisting systems shall be made to conform to the
requirements of Sections 3403A, 3412A through 3414A;
or additions shall meet all of the requirements of these
regulations for new construction using an importance
factor, 1, equal to or greater than 1.0.

3411A.3.2.3 Major structural alteration, additions or
repairs. Major structural alterations, additions or
repairs shall be permitted, provided the entire building,
as modified, including the structural alterations or
repairs, conforms to the requirements of Sections 3403A,
3412A through 3414A for no less than SPC 2. Additions
shall meet the requirements of these regulations for new
construction.

It shall also be demonstrated by a written report sub-
mittcd by the structural engineer, acceptable to the
enforcement, that an investigation of the existing
building structure shows it to be constructed in a reason-
able conformance with the submitted drawings and spec-
fications.

3411A.3.2.4 Removal of stories. An alteration which
involves the removal of one or more entire stories will be
permitted if the lateral-load-resisting capacity of the
remaining structure is not reduced.

An alteration which involves the removal of other than
one or more entire stories will be permitted in accor-
dance with Sections 3403A, 3412A through 3414A.

SECTION 3412A
EARTHQUAKE EVALUATION AND DESIGN FOR
RETROFIT OF EXISTING HOSPITAL BUILDINGS

3412A.1 Purpose. All modifications, alterations, and/or
repairs to existing structures or portions thereof shall, at a mini-
mum, be designed and constructed to resist the effects of seis-
mic ground motions as provided in this section. When applicable,
the structural system shall be evaluated by the design profes-
sional of record and, if not meeting or exceeding the minimum seismic design requirements of this section, shall
be retrofitted in compliance with these requirements.

3412A.1.1 Minimum seismic design. The purpose of this
section is to provide a minimum level of seismic perfor-
mance. At this essential life safety level (seismic perfor-
mance category, SPC 2), in general, persons in and around
the building will be safely exited or be evacuated from
the building or its vicinity following an earthquake. It does
not mean that persons will not be injured or not be in need of
medical attention. This level of seismic performance is pre-
sumed to be achieved when: a) the building has some mar-
gin against either total or partial collapse of the structural
system even though significant damage may have occurred
that may not be economical to repair, b) major structural
elements have not fallen or been dislodged so as to pose a
life safety threat; and c) nonstructural systems or elements
that are heavy enough to cause severe injuries either within
or outside the building have not been dislodged so as to pose
a life safety threat. For buildings in seismic performance
categories SPC 3 through SPC 5, the purpose of this section
is to provide the immediate occupancy level of seismic per-
formance. At this level, the building and essential nonstruc-
tural systems will be reasonably capable of functioning
following an earthquake

3412A.2 Applicability.

3412A.2.1 The requirements of this section apply to hospital
building where Chapter 6, Part 1, Title 24 of the Building
Standard Administrative Code, so requires, whatever the
structure is to be retrofitted, repaired or modified and: 1) there
is a change in occupancy, 2) changes to structural ele-
ments that reduce the lateral load capacity by more than 5
percent at any story, 3) repair of structural elements where
the damage has reduced the lateral load capacity by more
than 10 percent at any story, 4) changes in live or dead load
that increase the story shear by more than 5 percent, or 5) where
required by Sections 3403A, 3411A or Chapter 6,
Part 1, Title 24, Building Standard Administrative Code.
Changes in Items 2, 3 and 4 are cumulative for past alter-
ations to the building.

Where Items 1 through 5 are not applicable, the alter-
ation, retrofit or repair shall meet the requirements of this
section, but upgrade of the whole structure is not required.

3412A.2.2 Evaluation required. If the criteria in Section
3412A.2.1 apply to the project under consideration, the
design professional of record shall provide an evaluation in
accordance with FEMA 356, as modified herein, to deter-
mine the seismic performance of the building in its current
configuration and condition. If the structure's seismic per-
formance is evaluated as satisfactory and the enforcement
agent concurs, then no structural retrofit is required.

Exception: In some cases a technical review and evaluation
may be waived under the exception of Section
3413A.1, where the life safety threat posed by the build-
ing is clearly minimal.

3412A.2.3 Retrofit required. Where the evaluation indi-
cates the building does not meet the SPC performance
objective of this section, the owner shall take appropriate
steps and either 1) undertake the seismic retrofit as part of
the modifications, alterations and/or repairs; or 2) provide
a plan, acceptable to the enforcement agent, to complete
the seismic retrofit in a timely manner.

3412A.3 The modification to any existing building may be pre-
pared in accordance with the requirements of a new building in
this code.

3412A.4 The structural system allowances of Sections
3403A.2.1 and 3403A.2.2 do not apply to any building to which
Sections 3411A through 3414A apply.
SECTION 3413A
SEISMIC REHABILITATION OF BUILDINGS

3413A.1 General. The existing or retrofitted structure shall be demonstrated to have the capability to sustain the deformation response due to the specified earthquake ground motions. The engineer shall provide an evaluation of the response of the existing structure in its current configuration and condition to the ground motions specified. If the building's seismic performance is evaluated as satisfactory and the enforcement agent concurs, then no further engineering work is required. When the evaluation indicates the building does not meet the objective of safety goals of this chapter and the applicable structural seismic performance (SPC) and nonstructural seismic performance (NSP) requirements, then a retrofit and/or repair design shall be prepared that yields a structure that meets the life safety and operational performance objectives of Section 3412A and reflects the appropriate consideration of existing conditions. Any approach to analysis and design may be used that yields a building of reliable stability in the prescribed design earthquake loads and conditions. The approach shall be rational, shall be consistent with the established principals of mechanics and shall use the known performance characteristics of materials and assemblages under reversing loads typical of severe earthquake ground motions.

Exception: Further consideration of the structure's seismic performance can be waived by the enforcement agent if both the engineer-of-record and enforcement agent conclude that the structural system can be expected to perform at least as well as required by the provisions of Sections 3403A, 3412A through 3414A without completing an analysis of the structure's conformance to these requirements. A detailed report shall be submitted to the responsible enforcement agent that presents the reasons and basis for this conclusion. This report shall be prepared by the engineer-of-record. The enforcement agent shall concur in this conclusion and affirm to it in writing.

3413A.2 Modifications to FEMA 356. This section is applicable to seismic evaluation, analysis and design using the provisions of FEMA 356 per Section 3403A.2.3. The text of FEMA 356 shall be modified as indicated in Sections 3413A.2.1 through 3413A.2.37.

3413A.2.1 FEMA 356 Sections 1.3, 1.4, 1.5. Replace FEMA 356 Sections 1.3, 1.4 and 1.5 as follows.

Seismic Rehabilitation Process and Objective. Seismic evaluation procedure, building performance level and rehabilitation objectives for hospital buildings shall be per California Building Standards Administrative Code (Part 1, Title 24 CCR), Chapter 6.

3413A.2.2 FEMA 356 Section 1.6 Seismic Hazard. Replace FEMA 356 Section 1.6 by the following:

The ground motion characterization shall be based on ground shaking having a 10-percent probability of exceedance in 50 years for category SPC 2 at the essential life safety performance level. For SPC 3 through SPC 5, the ground motion characterization shall be based on ground shaking having a 10-percent probability of exceedance in 50 years at the immediate occupancy performance level and the maximum considered earthquake at the collapse prevention performance level.

Ground shaking having a 10-percent probability of exceedance in 50 years need not exceed two-thirds of the maximum considered earthquake.

Response spectra and acceleration time histories shall be constructed in accordance with Sections 1613A, 1614A and 1802A.6.

3413A.2.3 FEMA 356 Section 2.2.6. Modify FEMA 356 Section 2.2.6 by the following:

Data Collection Requirements. The extent of data collection shall be at Usual level for SPC 2 and Comprehensive level for SPC 3 through SPC 5 per FEMA 356 Table 2-1. Materials properties testing program shall be preapproved by the enforcement agent.

For buildings built under an OSHPD permit based on 1976 or later edition of California Building Code, where materials properties are shown on design drawings and original materials test data are available, no materials testing shall be required when approved by the enforcement agent.

3413A.2.4 FEMA 356 Section 2.4.1.1. Modify FEMA 356 Section 2.4.1.1 by the following:

Method to Determine Limitations on Use of Linear Procedures. The applicability of linear procedures shall be determined as follows:

1. If all component DCRs ≤ 1.5 for SPC 3 through 5 buildings or 2.0 for SPC-2 buildings, then linear procedures are applicable.

2. If up to 10 percent of the component DCRs exceeds 1.5 and no irregularities described in Sections 2.4.1.1 through 2.4.1.4 are present, then linear procedures are applicable.

3. If one or more component DCR exceed 1.5 and any irregularity described in Sections 2.4.1.1 through 2.4.1.4 are present, then linear procedures are not applicable and shall not be used.

4. Linear procedures are not applicable to moment-resisting frames where plastic hinges do not form in either the beam at the face of column or in the column panel zone.

3413A.2.5 FEMA 356 Section 2.4.2.1 Modify FEMA 356 Section 2.4.2.1 by the following:

Nonlinear Static Procedure. If higher mode effects are significant, either the Nonlinear Dynamic Procedure or Modal Pushover Analysis Procedure, subject to the approval of the enforcement agent, shall be used.

3413A.2.6 FEMA 356 Section 2.4.4.5. Modify FEMA 356 Section 2.4.4.5 by the following:

Material Properties. Expected material properties are not permitted to be determined by multiplying lower bound values by the assumed factors specified in Chapters 5 through 8.
3413A.2.7 FEMA 356 Section 3.2.10.1 Modify FEMA 356 Section 3.2.10.1 by the following:

**Linear Procedures.** Equation 3-6 is not permitted by OSHPD.

3413A.2.8 FEMA 356 Section 3.3.1.3.1. Modify FEMA 356 Section 3.3.1.3.1 by the following:

**Pseudo Lateral Load.**

\[ C_2 = \text{Modification factor to represent the effects of pinched hysteresis shape, stiffness deterioration and strength deterioration on maximum displacement response. Values of } C_2 \text{ for different framing systems and structural performance levels shall be obtained from Table 3-3. For linear procedures, } C_2 \text{ may be taken as 1.0 if all DCRs are less than 1.5.} \]

3413A.2.9 FEMA 356 Section 3.3.1.3.5. Replace FEMA 356 Section 3.3.1.3.5 as follows:

**Unreinforced Masonry Buildings.** Unreinforced masonry not permitted by OSHPD.

3413A.2.10 FEMA 356 Section 3.3.3.2.4. Modify FEMA 356 Section 3.3.3.2.4 by the following:

**Idealized Force-Displacement Curve.** The effective yield strength, \( V_y \), and yield displacement of the building shall not be used to determine acceptance criteria based on displacement ductility or strength beyond the provisions without approval of the enforcement agent.

3413A.2.11 FEMA 356 Section 3.3.3.3.2. Modify FEMA 356 Section 3.3.3.3.2 by the following:

**Target Displacement.**

\[ C_3 = \text{Modification factor to represent the effects of pinched hysteresis shape, stiffness deterioration and strength deterioration on maximum displacement response. Values of } C_3 \text{ for different framing systems and structural performance levels shall be obtained from Table 3-3.} \]

3413A.2.12 FEMA 356 Table 3-3. Modify FEMA 356 Table 3-3 by the following:

**Values for Modification Factor } C_3.**

Footnote 1. Structures in which more than 30 percent of the story shear at any level is resisted by any combination of the following components, elements or frames: ordinary moment resisting frames, concentrically braced frames, frames with partially restrained connections, tension-only braces, unreinforced masonry walls, shear-critical piers and spandrels of reinforced concrete or masonry, flexurally controlled reinforced concrete and masonry walls without boundary elements and welded steel special moment-resisting frames with pre- and post-tensioned connections.

3413A.2.13 FEMA 356 Section 3.4.2.2. Modify FEMA 356 Section 3.4.2.2 by the following:

**Acceptance Criteria for Linear Procedures—Drift Limitations.** The interstory drift ratio shall not exceed the following values for the specified systems for the performance level under consideration. For dual systems, the least interstory drift ratio shall control.

3413A.2.14 FEMA 356 Section 3.4.3.2.1. Modify FEMA 356 Section 3.4.3.2.1 by the following:

**Deformation-Controlled Actions.** For SPC-3 through SPC-5, primary components shall be within the acceptance criteria for primary components and secondary components shall be within the acceptance criteria for secondary components.

3413A.2.15 FEMA 356 Section 4.4. Modify FEMA 356 Section 4.4 by the following:

**Foundation Strength and Stiffness.** Foundation and soil strength shall be used to evaluate potential overturning, uplift and sliding for fixed base assumptions, and stiffness for flexible base assumptions, including deformations associated with those actions.

3413A.2.16 FEMA 356 Section 4.4.1.1. Replace FEMA 356 Section 4.4.1.1 as follows:

**Presumptive Capacities.** Not permitted by OSHPD.

3413A.2.17 FEMA 356 Section 4.4.1.2. Replace FEMA 356 Section 4.4.1.2 as follows:

**Prescriptive Expected Capacities.** Not permitted by OSHPD.

3413A.2.18 FEMA 356 Section 4.4.4.2.2. Modify FEMA 356 Section 4.4.4.2.2 by the following:

**Flexible Base Assumption.** The soil strength shall be evaluated.

3413A.2.19 FEMA 356 Section 4.5. Modify FEMA 356 Section 4.5 by the following:

**Seismic Earth Pressure.** Where the grade difference from one side of the building to another exceeds one-half story height, the seismic increment of earth pressure shall be added to the gravity lateral earth pressure to evaluate the building overturning and sliding stability and the lateral force-resisting system below grade in combination with the building seismic forces.

3413A.2.20 FEMA 356 Table 5-6. Modify FEMA 356 Table 5-6 by the following:

**Acceptance Criteria for Nonlinear Procedures—Structural Steel Components.** For fully and partially restrained moment connections, the plastic rotation angles and residual strength ratios used shall be substantiated by the statistical analysis of three or more applicable cyclic test results.
subject to the approval of the enforcement agent, except when connections satisfy requirements of AISC 358.

3413A.2.21 FEMA 356 Section 6.8.1.1. Modify FEMA 356 Section 6.8.1.1 by the following:

**Monolithic Reinforced Concrete Shear Walls and Wall Segments.** For nonlinear procedures, shear walls or wall segments with axial loads greater than 0.35, $P_o$ shall be included in the model as primary elements with appropriate strength and stiffness degrading properties assigned to those components subject to the approval of the enforcement agent. For linear procedures, the effects of deformation compatibility shall be investigated using moment-curvature section analyses and cyclic testing results of similar components to determine whether strengthening is necessary to maintain the gravity load carrying capacity of that component.

3413A.2.22 FEMA 356 Section 6.8.2.3. Modify FEMA 356 Section 6.8.2.3 by the following:

**Strength.** The effective tension and compression flange widths for shear walls or wall segments shall be taken as one-half of the distance to the next wall web or 25 percent of the total wall height, whichever is less.

3413A.2.23 FEMA 356 Section 7.4.2. Replace FEMA 356 Section 7.4.2 as follows:

**Unreinforced Masonry Walls and Piers In-plane.** Not permitted by OSHPD.

3413A.2.24 FEMA 356 Section 7.4.3. Replace FEMA 356 Section 7.4.3 as follows:

**Unreinforced Masonry Walls Out-of-plane.** Not permitted by OSHPD.

3413A.2.25 FEMA 356 Section 7.4.4.2.2. Shear strength of walls and piers. Modify FEMA 356 Section 7.4.4.2.2 by the following:

The spacing of shear reinforcing, $S$, shall be less than or equal to the wall pier clear height divided by 2 or the story height divided by 2, whichever is smaller.

3413A.2.26 FEMA 356 Section 8.3.2.5. Modify FEMA 356 Section 8.3.2.5 by the following:

**Default Properties.** Component construction in the building shall be verified to meet the material properties, including fastener size and spacing used in the test assemblies establishing the expected strength and stiffness values given in Tables 8-1 and 8-2.

3413A.2.27 FEMA 356 Sections 8.5.4.3, 8.5.5.3, 8.5.6.3, 8.5.7.3, 8.5.8.3. 8.5.9.3, 8.5.10.3, 8.5.11.3, 8.5.12.3, 8.5.13.3, 8.5.14.3, 8.5.15.3, 8.5.16.3, 8.5.17.3, 8.6.3.3, 8.6.4.3, 8.6.5.3, 8.6.6.3, 8.6.7.3, 8.6.8.3, 8.6.9.3, 8.6.10.3, 8.7.2, 8.8.1.3. Modify FEMA 356 Sections listed by the following:

**Acceptance Criteria.** Component construction in the building shall be verified to meet the material properties, including fastener size and spacing used in the test assemblies establishing the $m$-factors and displacement ductility values given in Tables 8-3 and 8-4.

3413A.2.28 FEMA 356 Section 9.2.4. Modify FEMA 356 Section 9.2.4 by the following:

**Linear Procedures.** Verification of the interstory lateral displacements, isolator displacements, the strength adequacy of the seismic-force-resisting system and isolation system and anchorage to the foundation shall be accomplished using the Nonlinear Dynamic Procedure.

3413A.2.29 FEMA 356 Section 9.2.5.1. Modify FEMA 356 Section 9.2.5.1 by the following:

**Nonlinear Static Procedure.** Verification of the interstory lateral displacements, isolator displacements, the strength adequacy of the seismic-force-resisting system and isolation system and anchorage to the foundation shall be accomplished using the Nonlinear Dynamic Procedure.

3413A.2.30 FEMA 356 Section 9.2.9. Modify FEMA 356 Section 9.2.9 by the following:

**Isolation System Testing and Design Properties—Production Tests.** Production testing and associated acceptance criteria shall be as approved by the enforcement agent.

3413A.2.31 FEMA 356 Section 9.2.9.2.9. Modify FEMA 356 Section 9.2.9.2.9 by the following:

**Testing Similar Units.** The testing exemption shall require approval by the enforcement agent.

3413A.2.32 FEMA 356 Section 9.3.4. Modify FEMA 356 Section 9.3.4 by the following:

**Linear Procedures.** Verification of the interstory lateral displacements, damper relative velocities and displacements, the strength adequacy of the seismic-force-resisting system and damping system and anchorage to the foundation shall be accomplished using the Nonlinear Dynamic Procedure.

3413A.2.33 FEMA 356 Section 9.3.5.1. Modify FEMA 356 Section 9.3.5.1 by the following:

**Nonlinear Static Procedure.** Verification of the interstory lateral displacements, damper relative velocities and displacements, the strength adequacy of the seismic-force-resisting system and damping system and anchorage to the foundation shall be accomplished using the Nonlinear Dynamic Procedure.

3413A.2.34 FEMA 356 Section 9.3.8. Modify FEMA 356 Section 9.3.8 by the following:

**Required Tests of Energy Dissipation Devices—Production Tests.** Production testing and associated acceptance criteria shall be as approved by the enforcement agent.

3413A.2.35 FEMA 356 Chapter 10. Replace FEMA 356 Chapter 10 as follows:

**Simplified Rehabilitation.** Not permitted by OSHPD.

3413A.2.36 FEMA 356 Section 11.1. Modify FEMA 356 Section 11.1 by the following:

**Scope.** The seismic rehabilitations of nonstructural components and system shall satisfy the requirements of
EXISTING STRUCTURES

Building Standards Administrative Code (Part 1, Title 24 CCR), Chapter 6

341A.2.37 FEMA 356 Section 11.2. Modify FEMA 356 Section 11.2 by the following:

Procedure. The seismic rehabilitation objective shall be to satisfy the nonstructural performance requirements of Building Standards Administrative Code (Part 1, Title 24 CCR), Chapter 6

SECTION 341A
PEER REVIEW REQUIREMENTS

341A.1 General. Independent peer review is an objective technical review by knowledgeable reviewer(s) experienced in structural design, analysis and performance issues involved. The reviewer(s) shall examine the available information on the condition of building, basic engineering concept employed and recommendations for action.

341A.2 Timing of independent review. The independent reviewer(s) shall be selected prior to the initiation of substantial portions of the design and analysis work that is to be reviewed, and review shall start as soon as practical and sufficient information defining the project is available.

341A.3 Qualifications and terms of employment. The reviewer shall be independent from the design and construction team.

341A.3.1 The reviewer(s) shall have no other involvement in the project before, during or after the review, except in a review capacity.

341A.3.2 The reviewer shall be selected and paid by owner and shall have technical expertise in review of buildings similar to the one being reviewed, as determined by the enforcement agent.

341A.3.3 The reviewer (in case of review team, the chair) shall be a California-licensed structural engineer who is familiar with technical issues and regulations governing the work to be reviewed.

341A.3.4 The reviewer shall serve through completion of the project and shall not be terminated except for failure to perform the duties specified herein. Such termination shall be in writing with copies to the enforcement agent, owner and the engineer of record. When a reviewer is terminated or resigns, a qualified replacement shall be appointed within 10 working days.

341A.4 Scope of review. Review activities shall include, where appropriate, available construction documents, design criteria, observation of the condition of structure, all new and original inspection reports, including methods of sampling, analyses prepared by the engineer of record and consultants and the retrofit or repair design. Review shall include consideration of the proposed design approach, method, materials and details.

341A.5 Reports. The reviewer(s) shall prepare a written report to the owner and responsible enforcement agent that covers all aspects of the review performed, including conclusions reached by the reviewer. A report shall be issued after the schematic phase, during design development and at the completion of construction documents, but prior to the issuance of a permit. Such report shall include, at the minimum, statement of the following:

1. Scope of engineering design peer review with limitations defined.
2. The status of the project documents at each review stage.
3. Ability of selected materials and framing systems to meet the performance criteria with given loads and configuration.
4. Degree of structural system redundancy and the deformation compatibility among structural and nonstructural elements.
5. Basic constructability of the retrofit or repair system.
6. Other recommendations that will be appropriate for the specific project.
7. Presentation of the conclusions of the reviewer identifying any areas that need further review, investigation and/or clarification.
8. Recommendations

341A.6 Responses and corrective actions. The engineer of record shall review the report from the reviewer(s) and shall develop corrective actions and other responses as appropriate. Changes observed during construction that affect the seismic resisting system shall be reported to the reviewer in writing for review and recommendations. All reports, responses and corrective actions prepared pursuant to this section shall be submitted to the responsible enforcement agent and the owner along with other plans, specifications and calculations required. If the reviewer resigns or is terminated by the owner prior to completion of the project, then the reviewer shall submit copies of all reports, notes and the correspondence to the responsible enforcement agent, the owner and the engineer of record within 10 working days of such termination.
